USING THIS CATALOG

1. This catalog is as of April 2020.

2. Please note that products in this catalog are continuously reviewed and updated. The products therefore may be changed in the future and thus become different from the catalog.

3. Stock status is mentioned for the products in this catalog. However, please note that the products here may be replaced by new grades and products in the future.

   Note 1) Please contact us for dimensions not mentioned in this catalog.
   Note 2) Please contact us regarding order numbers and grades that are not mentioned in this catalog.

4. Stock status indication

   ● : USA Stock **★ : Stocked in Japan** **□ : Made to Order** **▲ : Inventory maintained To be replaced by new products**

HOW TO USE THIS CATALOG

In this catalog, our company's cutting tools are broadly divided into two types: turning tools and rotating tools, with separate respective sections for each machining method. Please select the search method that matches your requirements when using the catalog.

1. **Search for tool types from the CONTENTS.**

2. **To find the series of products from the index of the inside title**.
   Index of each block are listed on each inside title.

3. **To find the product according to application.**
   The classification page of each block provides the series of products to be selected according to applications and purposes.

4. **Search using the alphabetical index.**
   All tools are listed in the alphabetical index at the front of the catalog.

5. **How to use the block sections.**
   A usage guide for each block is shown on the left of each index (not for all blocks). Refer to this page to know how to read the product information and how the page is organized.

OTHER WAYS TO USE THE CATALOG

The following PR materials are also available in addition to this catalog, for use as necessary.

1. **Catalogs for individual products**
   • Access the following URL and download "Tool News" for the applicable cutting tool.
   Information about tool features and examples of cutting applications are available in greater detail.

   http://www.mmus-carbide.com/download/tools_news

2. **Online catalog (electronic catalog with search functions)**
   • Access the following URL to search for applicable cutting tools and view detailed information.
   CAD data, tooling sheets, and other resources are also available for download.

   http://www.mitsubishicarbide.net/mmus/enus/

STATEMENT

YOUR GLOBAL CRAFTSMAN STUDIO

Mitsubishi Materials is not just a tool manufacturer

We are committed to responding promptly to customers' challenges and to actively contribute to their success with the dedication of a professional craftsman.

We will strive to become the only tool manufacturer globally offering "your personal craftsman studio", a unique service for our customers.

It is the place where you can:
Find state-of-the-art technologies and products.
Find solutions, anytime, from anywhere in the world.
Share our excitement about the latest technology trends and product innovation.

It is the studio where we think, share, create and develop together with our customers, exciting solutions to meet their specific needs.

YOUR GLOBAL CRAFTSMAN STUDIO
MITSUBISHI MATERIALS

The meaning of our logo
Our logo shows people, standing on a circle, holding hands. The circle represents the earth. Holding hands reflect our commitment to grow and succeed "hand in hand" with our customers and closely work with them to improve performance across the globe. The shape of the logo embodies a variety of ideas. It captures the image of "cutting tools" combined with the dominant letter "M" of the Mitsubishi Materials brand name. It also depicts a flame that symbolises our passion for craftsmanship.

Now available!

A magazine for communication to
encourage excitement about manufacturing

YOUR GLOBAL CRAFTSMAN STUDIO

Access the MMC Magazine here

PRODUCT BRAND

With "DIAEDGE," Mitsubishi Materials Metalworking Solutions Company will aim to become the leading company in carbide product business while sharing ideas, creations and feelings with customers through the provision of optimised carbide product solutions and services.

DIAEDGE

Together with our customers, creating a better future

Announcing DIAEDGE, our new brand of tools
that brings together our cutting-edge technologies, exciting all who use them.
Our aim is not only to offer value with our tools,
but to think together with our customers, share inspiration with them,
and continue to take on new challenges.

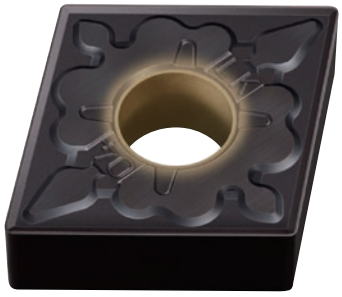
MC5015
+ LK
MK
RK



MC7000 Series
MP7000 Series

» A016
» A022

ISO Insert Series
for Stainless Steel Turning

M

A revolution in stainless steel turning.
Excellent resistance to notch wear with good burr control. Outstanding tool life achieved through high resistance to plastic deformation.

MC7015
MC7025
MP7035
+ LM
MM
RM
GM

MS6015

» D002

PVD Coated Carbide Grade
for Carbon Steel Turning

P

Series continues to evolve. The chip breaker made of the mold makes the finished surface very much improved.

MP9000 Series

» A019
» A026
» A040

ISO Turning Inserts
for Difficult-to-cut Materials

S

The high Al-rich (Al,Ti)N single layer coating significantly reduces edge fracturing.

MP9005
MP9015
MP9025
+ FS/LS
MS/RS

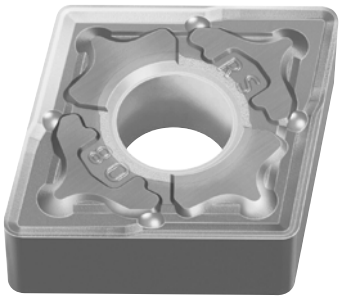
MT9000 Series

» A018
» A025
» A043

ISO Turning Inserts
for Difficult-to-cut Materials

S

Cemented carbide with unmatched resistance to heat and plastic deformation.



BC8100/MB8100 Series

» B006
» B010
» B015

CBN-series for Hardened
Steel Turning

H

New generation coating CBN grades. Wear and fracture resistance greatly improved for a wide range of continuous and interrupted applications.

MB4120

» B012
» B015

CBN Grade for Sintered
Alloy and Cast Iron

K

Excellent fracture resistance and stable cutting improves productivity.

Tool Solutions

TURNING TOOLS

FP Breaker

» A015
» A020
» A021

Finish Cutting Breaker for
Carbon Steel and Alloy Steel

Better choice for finish cutting of steels offers good chip control in wide cutting conditions.

FS-P/LS-P Breaker

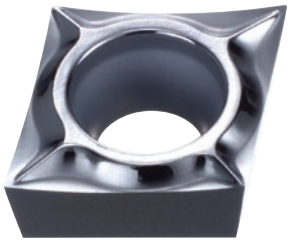
» A025
» D002

New Breaker System for
Front Turning

Polished (mirror-surface) finish of insert surfaces drastically improves welding resistance extending tool life.

FS-P Breaker

For Finish Cutting of
Titanium Alloys



LS-P Breaker

For Light Cutting of
Titanium Alloys

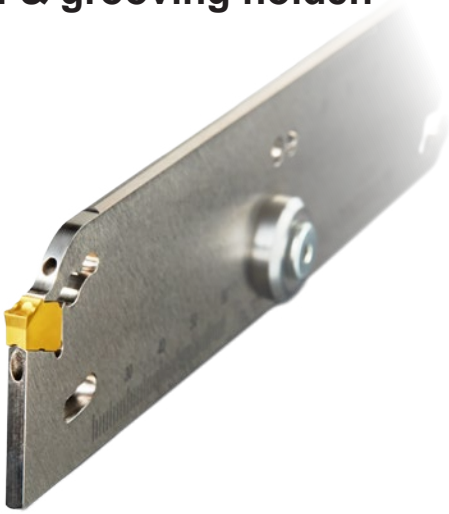
NEW

GW series

» F228

Cutting Off & Grooving Holder

**Long lasting, easy to use.
Cutting off & grooving holder.**



GY series

» F004

Grooving
& Cutting Off System

**Grooving revolution.
Innovative clamping system ensures reliable grooving.**

Tool Solutions

INDEXABLE MILLING

NEW

WJX series

» L224

Double-sided Insert Type
High Feed Radius Milling Cutter

Improved sharpness and stability to achieve high efficiency machining.

FMAX series

» L070

High Feed Finish Milling
Cutter for Aluminum Alloys

Feed Maximum (FMAX) milling cutter for ultra efficient and accurate finishing.

NEW

VPX series

» L124
» L140

Multi-functional Cutter
for High Efficiency Machining

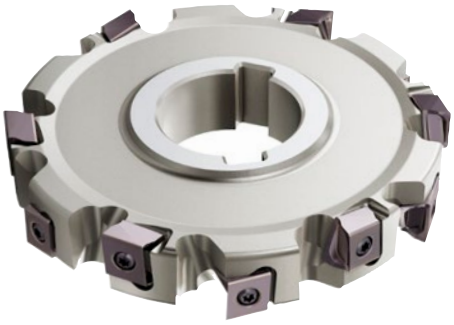
Boost your milling with a tough tangential insert !

VAS400/500series

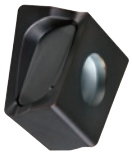
» L088

Exchangeable Inserts
Side Cutter

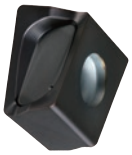
Side cutter with low cutting resistance. Vertical mount double-sided insert for VAS series.



Strong Cutting Edge Type R Breaker



Low Resistance Type M Breaker



Tool Solutions

SOLID END MILLS

MSplus series

» I086

Carbide End Mills

Tough applications require ''Plus'' performance.

iMX End Mill Series

» J001

Exchangeable Head End Mills

Carbide + Carbide double face contact with head type expands the application possibilities.

SMART MIRACLE Series

» I124

Vibration Control End Mills for Machining Difficult-to-cut Materials

Revolutionary performance for difficult-to-cut materials.

IMPACT MIRACLE REVOLUTION

» I246

For Machining of Hardened Steels

Revolutionary hardened steel. New coating provides amazingly long life.

Tool Solutions

DRILLING

MFE series

» M162

Solid Carbide Flat Bottom Drills

High efficiency drilling in various types of machining.

MVX series

» M176

Indexable Drills

High rigidity body produced by utilising the latest technology.

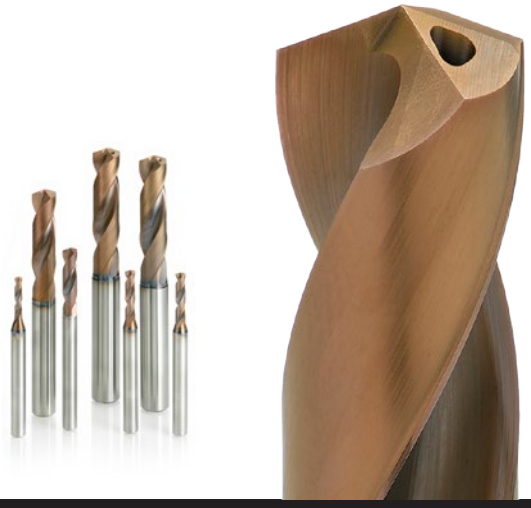
NEW

DSA series

» M158

Solid Carbide Drills for Machining Heat Resistant Alloy

New grade for machining of heat resistant alloy.



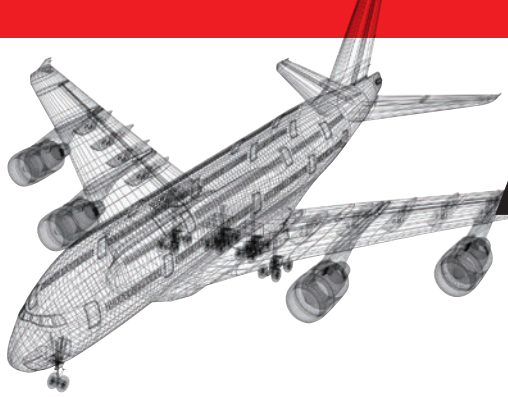
NEW

DLE series

» M172

Solid Carbide Drills for Centering and Chamfering

Excellent sharpness and fracture resistance provides stable cutting and burr prevention.



AEROSPACE

We offer latest cutting tools that enable high efficiency machining of difficult-to-cut parts in response to meet the needs of aerospace industry.

Customer Service

Cutting Solution Service

Machining Technology Center

RESPONSIVE, ATTRACTIVE, PROACTIVE

Mitsubishi Materials Corporation, Metalworking Solutions Company, offers a "Comprehensive Craftsman Studio" which addresses the individual needs and requirements of our customers' in order to make their business successful. Here the Machining Technology Center is the front-line base. It is fully equipped with advanced machines, measuring instruments, extensive cutting data, knowledge, technologies as well as having a team of highly-experienced technical staff members. All of which allows Mitsubishi Materials Corporation to offer the best solution and services for our valued customers.

MTEC Saitama (East Japan Technical Center)

MTEC Gifu (Central Japan Technical Center)

MTEC Valencia (ESPANA)

MTEC Stuttgart (GERMANY)

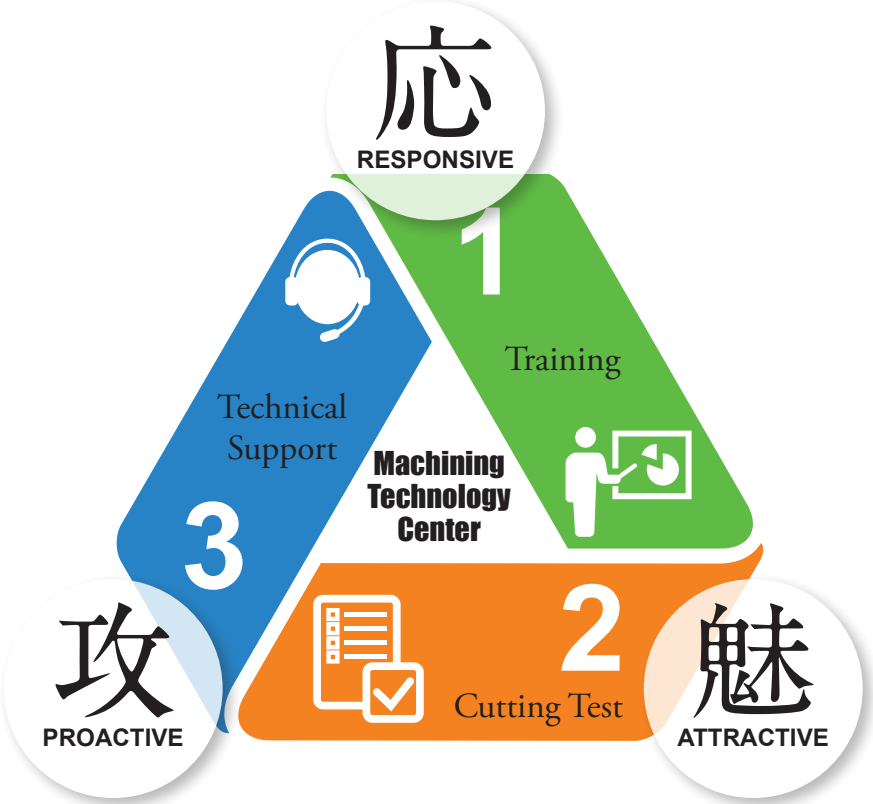
MTEC Querétaro (MEXICO)

MTEC Bangkok (THAILAND)

MTEC TianJin (CHINA)

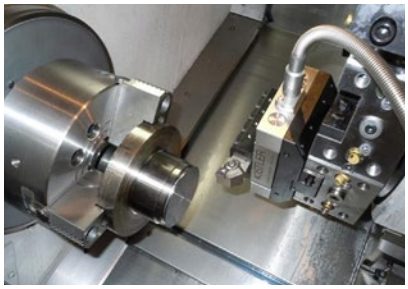
MTEC North Carolina (USA)

We try answering any questions and demands from customers around the world and providing detailed solutions as well as meeting customers' expectations along with a sustainable growth of technical skills and services.



We identify the potential needs of customers and develop innovation tools to cultivate new markets for widening future business possibilities.

Showing and demonstration, Attractive events and practical seminars present the new possibilities in machining which evoke a feeling of curiosity.



1 Practical "Hands-on" training with real demonstration

TRAINING

- **Cutting Academy**
- **e-learning**
- Regional seminar
- Requested Seminar

2 Visualizing your machining

CUTTING TEST

- Test Cutting
- Selection of optimal machining conditions
- Improvements in tool life and machining quality
- Predictive tests before line input
- High-speed camera/ Cutting force/ 3D measuring device etc.

3 "RESPONSIVE", with the provision of technical services

TECHNICAL SUPPORT

- Production line diagnosis/ Process improvement
- Tooling
- Cutting Simulation
- Telephone Technical counseling

Memo

SAFETY OF CUTTING TOOL PRODUCTS

1. Use of Cutting Tool Products

Packages of Mitsubishi products carry a safety warning label. However, tools are not labeled with detailed warning instructions. Please read the "Safety of Cutting Tool Products" in this catalog before handling cutting tool products and cemented carbide materials. Moreover, as a part of your workers' safety education, please notify the contents of the "Safety of Cutting Tool Products" to all workers.

2. Basic Characteristics of Hard Tool Materials

In Terms of "Safety of Cutting Tool Products"

Hard Tool Materials : General term for tool materials like cemented carbide alloy, cermet, ceramics, sintered CBN, sintered diamond, high speed steel and alloy steel, etc.

Physical Characteristics

Appearance : Varies depending on the type of material, e.g. gray, black, gold, etc.

Smell : None

Hardness, Specific Gravity :

Hard Tool Materials	Hardness (HV)	Specific Gravity	Hard Tool Materials	Hardness (HV)	Specific Gravity
High Speed Steel (HSS)	200—1200kg/mm²	7—9	Sintered CBN	2000—5000kg/mm²	3—5
Cemented Carbide	500—3000kg/mm²	9—16	Sintered Diamond	8000—12000kg/mm²	3—5
Cermet	500—3000kg/mm²	5—9	Alloy Steel	200—1200kg/mm²	7—9
Ceramics	1000—4000kg/mm²	2—7	Diamond Electroforming Product	8000—12000kg/mm²	3—5

Constituents

Carbide, nitride, carbon nitride, oxide, W, Ti, Al, Si, Ta, B, V and metals such as Fe, Co, Ni, Cr, Mo.

3. Safety of Cutting Tool Products

○Hard tool materials have a large specific gravity. Thus, they require special attention as heavy materials when the size or quantity is large.

○Hard tool materials generates dust and mist during grinding operations or heating. This dust and mist can be harmful to the human body when coming in contact with the eyes or skin, or if substantial quantities are swallowed. When grinding and machining, it is recommended to use local exhaust ventilation and respirators, a dust protective mask, glasses, gloves and so on. If dust makes contact with the hands, thoroughly wash the affected area with soap and water. Don't eat in the exposed area, and wash hands thoroughly before eating. Remove dust from the clothing by a cleaner or washing, but don't shake off.

○Cobalt dust can affect the skin, respiratory organs and heart through repeated or prolonged contact.

○For further information, please refer to **SDS** (Safety Data Sheet).

Home page: http://www.mmus-carbide.com/download/safety/

4. Handling Cutting Tool Products

○Surface conditions affect toughness of cutting tools. Therefore, use a diamond grinding wheel for finishing.

○Hard tool materials are extremely hard and brittle at the same time. Thus, they may be broken by shock and tightening with excess force.

○Hard tool materials and ferrous materials have different thermal expansion ratios. Shrinkage or swell fit products may suffer from cracks when applied temperature is higher or lower than the appropriate temperature for the tool.

○Pay special attention regarding storing hard tool materials. Toughness of hard tool materials is lowered when they corrode due to coolant and other liquid.

○When brazing hard tool materials, if the temperature is too high or too low from the melting point of the brazing material, loosening and breakage may occur.

○After regrinding cutting tools, make sure that there are no cracks.

○Machining hard tool materials on EDM may cause cracks on the surface due to remaining electrons resulting in lowering the toughness. Eliminate cracks by grinding, etc.

SUGGESTIONS ON HOW TO USE CUTTING TOOLS

Products	Hazard	Countermeasure
All Cutting Tools	◎Cutting tools have sharp cutting edges. Handling them with bare hands may cause injuries.	* Take precautions such as wearing gloves especially when handling tools and during installation.
	◎Improper use of tools and application of inappropriate cutting conditions may cause the tool to break and be discharged from the machine providing risk of injury.	* Ensure safety guards and goggles are used. * Refer to handling explanatory notes and catalogs. Use tools under recommended cutting conditions.
	◎Impact load and rapid increase of cutting resistance due to excessive wear may cause the tool to break and be expelled from the machine providing risk of injury.	* Ensure safety guards and goggles are used. * Exchange tools before excessive wear occurs.
	◎Cutting tools and workpieces become extremely hot during cutting. Touching them with bare hands may cause burns.	* Take precautions such as wearing gloves.
	◎Expelled hot chips produced in cutting produces risk of injuries and burns.	* Ensure safety guards and goggles are used. * During swarf removal and machine cleaning ensure the machine is stopped and wear gloves. Please use tools, such as cutting nippers and cutting clippers.
	◎In cutting, sparks, hot chips and heat generation caused by tool breakage provides a risk of igniting a fire.	* Avoid using cutting tools in places where there is a possibility of igniting a fire. * In case of using non-water soluble oil, make sure to have a fire prevention countermeasure.
	◎Using machines, chucks, and tools with poor balance at high revolutions may cause tools to break providing risk of injuries.	* Ensure safety guards and goggles are used. * Check the machine for vibration, chattering, and abnormal noise.
	◎Handling machined parts with burrs using bare hands may cause injuries.	* Wear gloves.
Indexable Inserts Type Tools	◎If inserts and spare parts are not held securely, they may become loose and be ejected producing risk of injuries.	* Clean insert locating seat and spare parts before setting inserts. * Use the tool provided for setting inserts, and ensure the inserts and spare parts are clamped securely. Do not use the tool provided for things other than prescribed inserts and spare parts.
	◎Clamping inserts and spare parts too tightly by using tools such as extension pipes may cause them to break and be scattered.	* Do not use extra tools for more leverage. Only use the tool provided.
	◎When applying high cutting speed, spare parts and inserts may be expelled due to centrifugal force. Pay special attention on each safety guidline.	* Refer to the handling explanatory notes and catalogs. Use tools under recommended cutting conditions.
Cutters and Other Rotating Tools	◎Milling cutters have sharp edges. Handling them with bare hands may cause injuries.	* Take precautions such as wearing gloves.
	◎Poor balance or off center revolving of tools may cause vibration and chattering which could cause the tool to break and be discharged.	* Apply cutting speed within the range of recommended cutting conditions. * Adjust accuracy and balance of spindles and bearings periodically to prevent off center revolving and chattering caused by wear on these parts.
Drilling Tools	◎Through cutting in cases when the workpiece revolves may produce a disk shaped peice with sharp edges when the cutting tool breaks through.	* Ensure safety guards and goggles are used. Also install a cover on the chuck.
	◎Drills with an extremely small diameter have a very sharp point which may puncture the skin if not handled carefully. If the drill breaks during cutting, the broken parts may be scattered.	* Handle with care. Take precautions such as wearing gloves and goggles.
Brazed Tools	◎Weakening of the braze and breakage of inserts may cause injury.	* Before using them, ensure they are brazed securely. * Do not use them under conditions which produce very high temperature.
Others	◎Machine and tools may be damaged if they are used for purposes other than the prescribed application.	* Use them strictly for the prescribed application.

INFORMATION

This catalog completes the basic precautions for safety use of our company's products. For further information, please refer to the guideline, catalogs or contact us. We are not responsible for any accidents caused by modifying tools without our permission.

HOW TO READ THE STANDARD OF TURNING INSERTS

●How this section page is organized

①Organized according to turning insert shape.
(Refer to the index on the next page.)

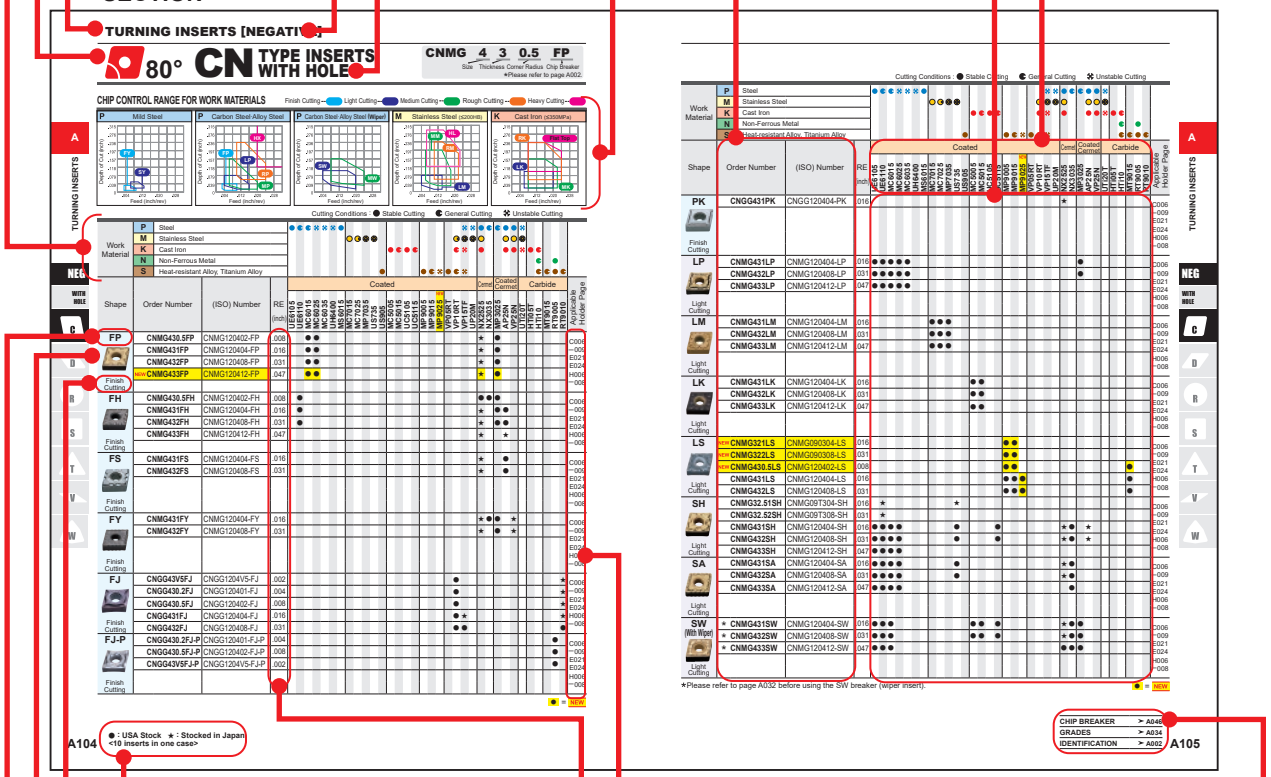
②Inserts are arranged in order of :
- Negative inserts (with hole→without hole)
- Positive inserts (with hole→without hole)

③Breakers are arranged in order of :
Finish Cutting→Light Cutting→Medium Cutting →Rough Cutting→Heavy Cutting

●Graph of chip control by work material

Shows recommended chip breakers and chip control range according to work material and cutting application.
Graphs are colored according to cutting applications (Finish→Light→Medium→Rough→Heavy) and contain recommended breakers for each application.

Finish Cutting : Light Cutting : Medium Cutting :
Rough Cutting : Heavy Cutting :



●To Order : Please specify insert number and grade.

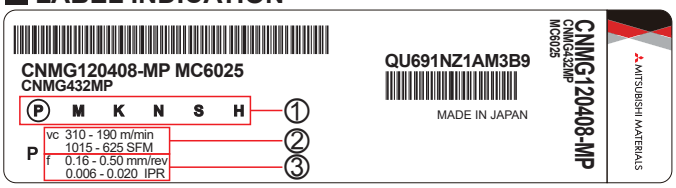
TOOL NAVI

■ OUTLINE

TOOL NAVI supports our customers with information and supplies suitable cutting conditions for each work material by selecting optimal indexable insert together with the optional tool.

■ LABEL INDICATION



*1. The above is an example. There may be inserts recommended for multiple work materials.
*2. Please contact us for recommended cutting conditions using coefficient values other than the above.

① Work materials

P : Steel (Material reference : Carbon steel, alloy steel 180HB)
M : Stainless steel (Material reference : Austenitic stainless steel 180HB)
K : Cast iron (Material reference : Gray cast iron, ductile cast iron 180HB)
N : Aluminum alloy, Non-ferrous metal
S : Material reference : Titanium alloy 320HB, Ni, Co-based alloy 400HB
H : Hardened steel 60HRC

② Cutting speed standards

Work Material	Tool Life		Work Material	Hardness
	Life	Performance		
P	90min.	15min.	Carbon steel, alloy steel	180HB
M	90min.	15min.	Stainless steel	180HB
K	90min.	15min.	Cast iron	180HB
S	25min.	5min.	Titanium alloy	320HB
			Ni, Co-based alloy	400HB
H	80min.	10min.	Hardened steel	60HRC

③ Feed rate

Minimum and maximum feed rate settings are based on the chip control range of the chip breaker.

*3. N : Life based on each grade. For stable conditions choose the performance cutting speed and for unstable choose the tool life feed rate.
*4. The tool life is based on the following (VB wear). Some materials include elements other than this.
PMKS • • • VB=0.3 mm
H • • • VB=0.1 mm

■ TOOL LIFE

Cutting speed has a large affect on tool life. **TOOL NAVI** is based on Taylor's equation (relationship vc x Tn=C between tool grade, cutting conditions, and tool life). Therefore, performance speed and tool life is found for each work material. When the customer requires different tool life, obtain coefficient values of the grade you use from the charts below. Multiply the coefficient values by the cutting speed to calculate the new cutting speed.

● P Grade (Steel) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
UE6105	1.00	0.79	0.69	0.63	0.55
MC6015	1.00	0.82	0.72	0.67	0.59
MC6025	1.00	0.83	0.75	0.69	0.62
MC6035	1.00	0.88	0.82	0.78	0.73
MP3025	1.00	0.85	0.77	0.72	0.65
NX2525	1.00	0.87	0.80	0.76	0.70

● M Grade (Stainless Steel) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
MC7015	1.00	0.83	0.75	0.70	0.63
MC7025	1.00	0.90	0.84	0.80	0.75
MP7035	1.00	0.84	0.76	0.71	0.62
US735	1.00	0.78	0.68	0.61	0.53

● K Grade (Cast Iron) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
MC5005	1.00	0.83	0.75	0.70	0.63
MC5015	1.00	0.83	0.75	0.69	0.62

(ex.) Medium cutting of steel
The 1st recommendation : MC6025
Indexable inserts : CNMG432MA
Recommended cutting speed : vc = 1015 SFM
(Tool life : 15min.)

↓

Tool life required by the customer : 30min.
1015×0.83≒840 SFM

■ HARDNESS OF WORKPIECE

Hardness of the work material also affects tool life. Mitsubishi's **TOOL NAVI** suggests cutting speed variations when hardness of the work material differs. Obtain the suitable coefficient value for each work material from the chart below. Multiply the coefficient value by the recommended cutting speed of the grade you use to calculate the new cutting speed.

Work Material	Soft ← (Hardness of work material) → Hard											
	120HB	140HB	160HB	180HB	200HB	220HB	240HB	260HB	280HB	300HB	320HB	340HB
P	1.34	1.19	1.08	1.00	0.92	0.85	0.80	0.75	0.71	0.68	0.64	0.61
M	1.41	1.23	1.10	1.00	0.91	0.85	0.78	0.72	0.68	0.64	0.61	0.58
K	1.27	1.19	1.09	1.00	0.97	0.91	0.88	0.85	0.81	0.78	0.75	0.72

OPTIMUM GRADES AND CHIP BREAKERS FOR EXTERNAL TURNING

● Selection of optimum inserts for turning

The following diagrams show for each work material, the optimal combination of suitable grades and chip breakers for each application area in turning.

■ CUTTING CONDITIONS

●	Stable Cutting	Continuous Cutting Constant Depth of Cut Pre-Machined Securely Clamped Component

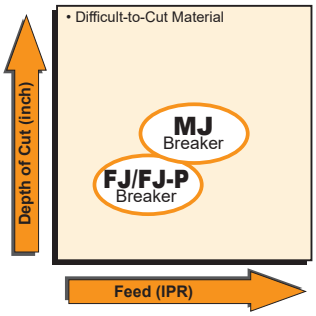
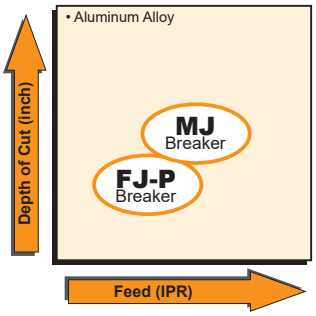
3D MOLDED CHIP BREAKERS (NEGATIVE INSERTS)

■CHIP CONTROL RANGE



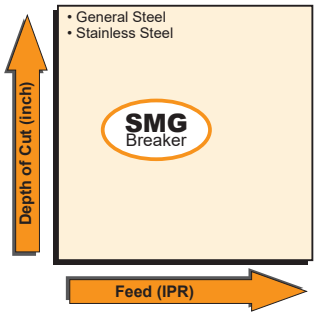


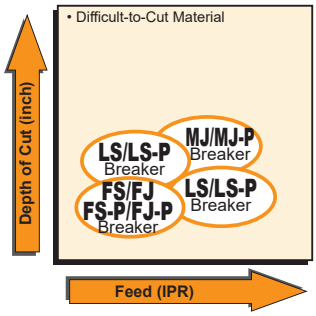
■FEATURES OF CHIP BREAKER

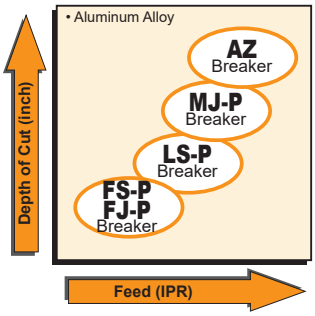
Breaker	Features	CNGG Type	DNGG/DNGM Type	VNGG/VNGM Type
FJ	● Ideal for heat-resistant alloy. ● The sharp edge produces good cutting surface.			
FJ-P	● Ideal for aluminum and copper. ● The sharp edge produces excellent surface finishes.		—	—
MJ	● Ideal for heat-resistant alloy and titanium alloy. ● The sharp edge produces excellent surface finishes.			

3D MOLDED CHIP BREAKERS (POSITIVE INSERTS)

■CHIP CONTROL RANGE







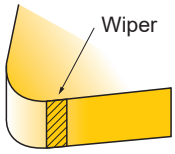
■FEATURES OF CHIP BREAKER

Breaker	Features	CCGT Type	DCGT Type	TCGT Type	VCGT Type	WCGT/RCGT Type
FS	● Ideal for heat-resistant alloys, titanium alloys, and cobalt chrome alloys. ● Sharp cutting edges provide excellent surface precision and finish.			—	—	—
FS-P	● Ideal for titanium alloys and copper alloys. ● Sharp cutting edges provide excellent surface precision and finish.			—	—	—
FJ	● The curved cutting edges support changes in cutting depth-smooth chip discharge and disposal. ● The large rake angle highly suitable for finishing difficult-to-cut materials.			—	—	—
FJ-P	● Ideal for aluminum and copper. ● The sharp edge produces excellent surface finishes.				—	
LS	● Ideal for heat-resistant alloy and titanium alloy and cobalt chrome alloy. ● Breaker protrusion suitable for depth of cut area achieves a wide range of chip control.			—		—
LS-P	● Ideal for aluminum and copper. ● The polished insert face prevents built up edge.			—		—
MJ	● The curved cutting edges support changes in cutting depth-smooth chip discharge and disposal. ● Large rake angle highly suitable for finish- light cutting difficult-to-cut materials.				—	
MJ-P	● Ideal for aluminum and copper. ● The sharp edge produces excellent surface finishes.				—	
SMG	● For medium cutting. ● 3D molded chipbreaker provides good chip control.Breaker geometry appropriate for copying and back turning.			—	—	—
AZ	● The high rake angle and 3D curved cutting edge provides sharpness at the cutting point. ● Additionally the 3D shape of the rake face enables excellent chip control.					

WIPER INSERT

What is a Wiper Insert?

- The wiper insert is designed with a wiper edge that is situated where the straight edge meets the corner radius.
- In comparison to conventional breakers, the surface finish does not deteriorate even if the feed rate is doubled.
- Machining at high feed rates improves cutting efficiency.



●Improving Surface Finish

Under the same machining conditions as conventional breakers, but with the feed rate increased, the surface finish of the work material can be improved.

●Improving Efficiency

High feed rates not only shortened machining times but also make it possible to combine roughing and finishing operations.

●Increased Tool Life

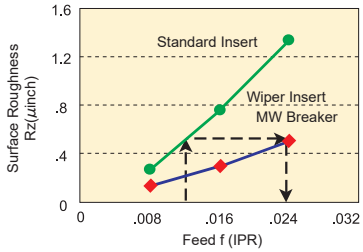
When a change to high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing the tool life of the insert.

●Improving Chip Control

Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.

Wiper insert + High feed (The feed rate is doubled.) — Finished surface Same surface roughness — **Standard insert + The conventional feed condition**

*Please use a wiper insert at high feed rate.



<Cutting Condition>
Work material : AISI 1045
Insert : CNMG432□□
Cutting Speed=655 SFM
Depth of Cut=.059 inch
Feed rate=.008−.024 IPR
with flood coolant

<Ex>The surface roughness does not deteriorate even if the feed rate is doubled (.012"→.024")!

■A wiper insert + machining at high feed rate

- Reduced machining time (per work material)
- Increased number of work material (per definitive time period)
- Improving chip control

■A wiper insert + machining at conventional feed rate

- Eliminating the finishing step by roughing and finishing together (Separate roughing and finishing steps → Single-step machining)

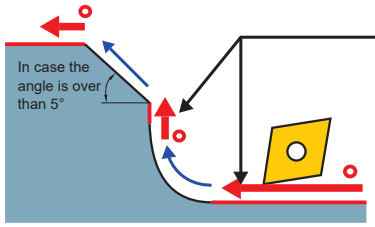
- Reducing cycle times
- Increased productivity
- Avoiding Line-Stoppage

<The Realization of Reduced Costs!!>

■ The estimate of finished surface roughness when using a wiper insert

The effects of wiper inserts on external machining, boring and facing.

*The surface roughness when machining at corner R or taper angle over 5°, is the same as machining with standard inserts.



Rz(W)=Rz×0.5

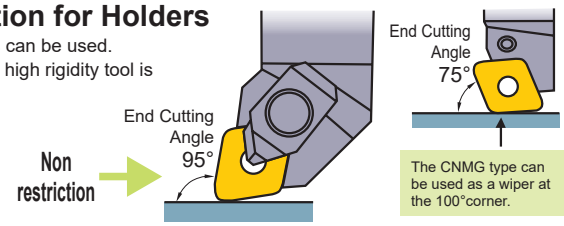
Rz(W) = Finished surface roughness when using a wiper insert.
Rz : Finished surface roughness from conventional conditions. (When using a standard insert)

Effective uses of a wiper insert
Non effective uses of a wiper insert

■ Special attention is not necessary when using CNMG • WNMG • CCMT types

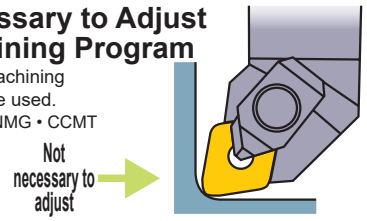
●No Restriction for Holders

A standard holders can be used.
(*A double clamp, high rigidity tool is recommended.)



●Not Necessary to Adjust the Machining Program

Conventional machining programs can be used.
(The CNMG • WNMG • CCMT types are based on the ISO/ANSI.)

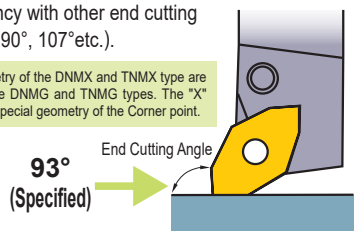


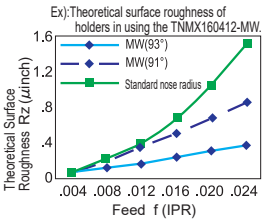
■ Special attention is necessary when using the DNMX • TNMX types due to the special top face geometry

●Restriction for Holders

Use a holder with end cutting angle 93° for improving wiper efficiency. A holder with end cutting angle 91° can improve wiper efficiency (see the following figure), however, there is no wiper efficiency with other end cutting angles (60°, 90°, 107°etc.).

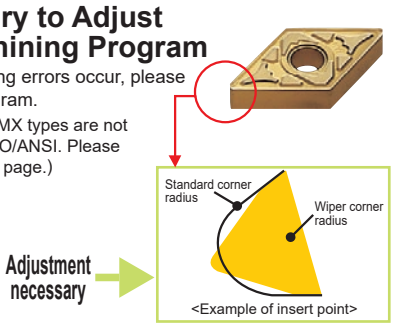
The hole geometry of the DNMX and TNMX type are the same as the DNMG and TNMG types. The "X" represents the special geometry of the Corner point.





●Necessary to Adjust the Machining Program

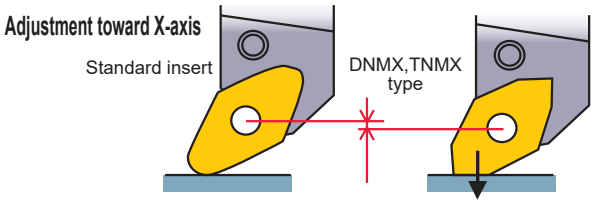
When machining errors occur, please adjust the program.
(The DNMX•TNMX types are not based on the ISO/ANSI. Please refer to the next page.)



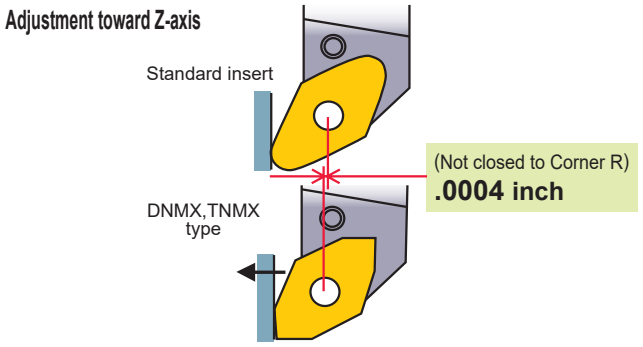
■Adjustment of machining programs for DNMX • TNMX types

Basic Process) Adjusting Toward X-axis and Z-axis

Adjusting the differential between a standard insert and Z-axis / X-axis.



Corner radius .016",.031" : **.0016 inch**
Corner radius .047" : **.0020 inch**

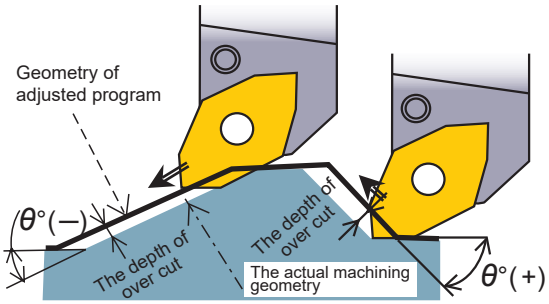


A) Adjusting a Taper

*Necessary to maintain a correct taper.

Adjust the relief angle toward the normal line.

Note1) Adjust the angle toward the normal line in the case where the adjustment number is minus (θ =60°—70°) and is not machined completely.



Classification

Nose Radius	Taper Angle θ°															
	-25—-15	-10	-5	**0**	5	10	15	20—35	40	45	50	55	60—65	70	75—85	**90**
.047	.0016	.0012	.0004	**0**	.0008	.0012	.0016	.0020	.0016	.0016	.0008	.0004	-.0004	0	.0004	**0**
.031	.0012	.0008	.0004	**0**	.0004	.0008	.0012	.0016	.0012	.0012	.0008	0	-.0004	0	.0004	**0**
.016	.0008	.0004	.0004	**0**	.0004	.0004	.0008	.0008	.0008	.0004	.0004	0	-.0004	-.0004	0	**0**

Values→ + numbers:adjustment of relief angle, -numbers:adjustment of plunge in angle (inch)

B) Adjusting a Corner R

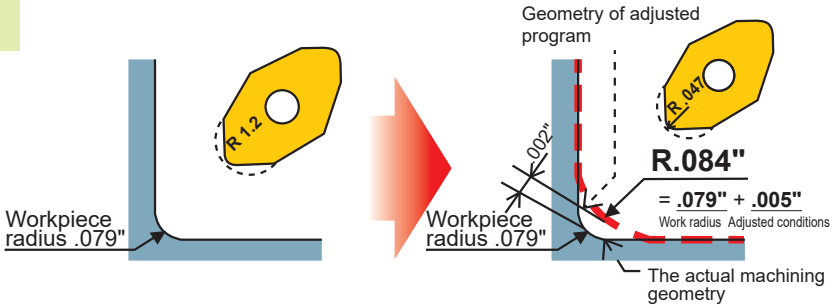
*Necessary to maintain a correct corner radius.

Adjust the work diameter same as the taper to prevent over-cut.

The value of adjustment to work R = Work R + the adjustment value
*No adjusting the corner radius in this case.

Ex) : In case of machining R .079" when using a corner R .047" type insert.

The corner radius of the insert	The adjustment amount on the workpiece radius.
Corner Radius .016" →	Work Radius**+.0020"**
Corner Radius .031" →	Work Radius**+.0043"**
Corner Radius .047" →	Work Radius**+.0055"**



The Easy-to-correct Method

In correcting corner radius:
It is not necessary to adjust the machining program, however, machining errors can occur within max. ± .0012" due to correcting by an approximate number.

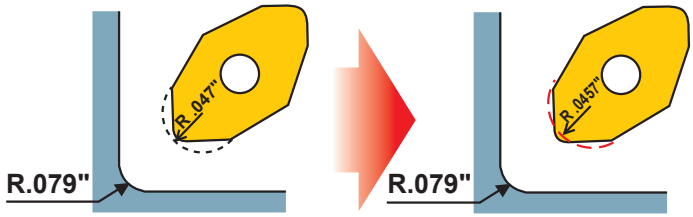
Corner Radius Correction

Input the correction number of each corner radius.

The value of corrected corner radius = approximation
*No adjustment required in machining program.

Ex):In the case of machining a corner with a radius R .079" when using an insert with a corner radius R .047".

The corner radius of a insert	The value of corrected corner radius = approximation
Corner Radius .016" →	**R.0142"**
Corner Radius .031" →	**R.0299"**
Corner Radius .047" →	**R.0457"**



Others) The value of correction is same for both DNMX and TNMX. Discriminate them by the size of corner radius.

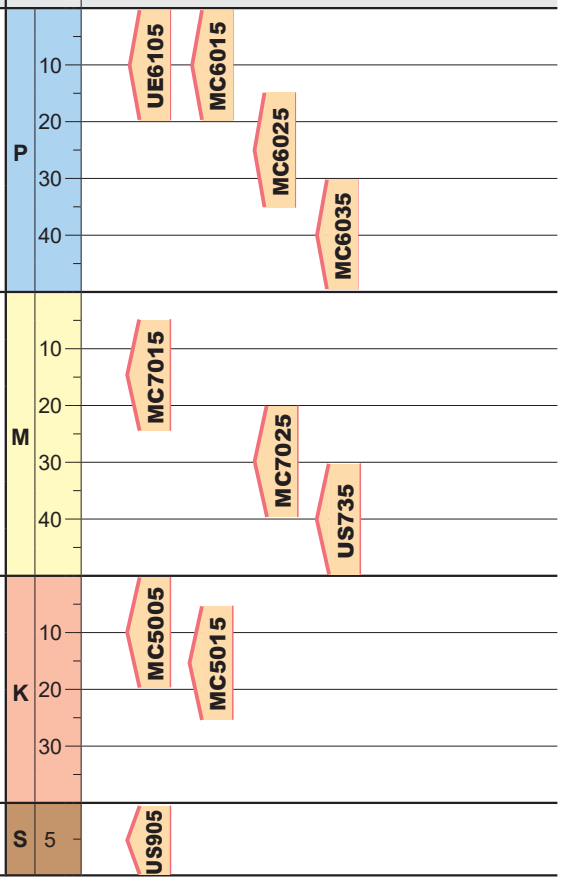
		Interrupted Cutting	**MC5015**	820 (490 — 985)
S	Heat Resistant Alloy	Continuous and Interrupted Cutting	**US905**	260 (165 — 330)

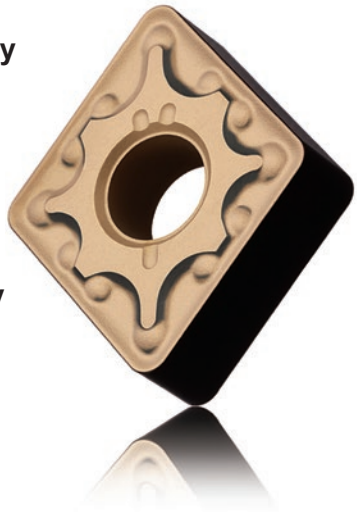


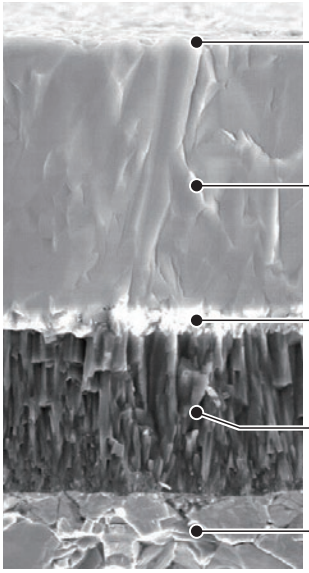
High reliability for a wide range of steel machining.

MC6015

Nano-Texture Technology
The optimized crystal growth in linear direction of Nano-texture coating technology maintains fine surface and provides outstanding wear and chipping under high speed cutting conditions.

TOUGH-Grip Technology
The interface between the layers is controlled at the nano level, allowing the TOUGH-grip layer extremely high levels of adhesion to prevent delamination.





Smooth coating surface
Prevents abnormal damage, welding and chipping

Ultra thick layer Nano-texture Al_2O_3
Delivers outstanding wear resistance even at high temperature

TOUGH-Grip
Prevents delamination of a coating

Nano-texture TiCN
Provides superior wear resistance and chipping resistance

Special carbide substrate
Prevents crack development
Stable tool life

■ GRADE CHARACTERISTICS

Work Material		Grade	Substrate	Coating Layer	
			Hardness (HRA)	Composition	Thickness
P	Steel	**UE6105**	90.8	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
		MC6015	90.2	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
		UE6110	90.3	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
		MC6025	90.2	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
		MC6035	89.5	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
		UH6400	89.5	Accumulated TiCN-Al_2O_3-Ti Compound	Thick
M	Stainless Steel	**MC7015**	90.7	TiCN-Al_2O_3-TiN	Thin
		MC7025	89.4	TiCN-Al_2O_3-TiN	Thin
		US735	89.0	Ti Compound	Thin
K	Cast Iron Ductile Cast Iron	**MC5005**	91.0	TiCN-Al_2O_3	Thick
		UC5105	92.2	TiCN-Al_2O_3	Thick
		MC5015	91.0	TiCN-Al_2O_3	Thick
		UC5115	91.0	TiCN-Al_2O_3	Thick
S	Heat Resistant Alloy	**US905**	92.2	TiCN-Al_2O_3-TiN	Thin

Note 1) Hardness shows representative value of the substrate.

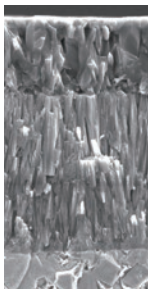
For interrupted cutting, medium to low surface speeds

MC6035

Prevents severe damage for increased stability

The smooth coating surface provides excellent welding resistance.
With the thickened TiCN, MC6035 also achieves superior wear resistance for increased stability.

MC6035

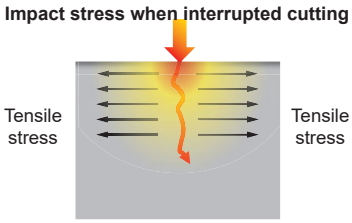


MC6025

Reducing the effect of severe fracturing

By reducing the tensile stress in the coating layer during interrupted cutting, crack development caused by impact stress is prevented.

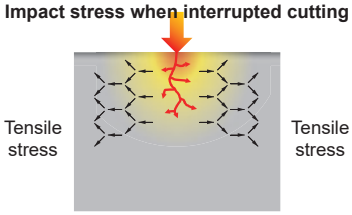
Impact stress when interrupted cutting



Conventional coating

Conventional products tend to result in fracturing because impact stress is transmitted deep into the coating layer during interrupted cutting.

Impact stress when interrupted cutting



MC6035

MC6035 has succeeded in alleviating tensile stress in the coating layer therefore, cracks that can develop by impact stress can be prevented when interrupted cutting.

COATED CARBIDE (PVD)

- PVD coating prolongs tool life under the same cutting conditions compared to uncoated carbide.
- Coating of tools with sharp edges is possible without softening or changing the edge quality of the substrate.

■ SELECTION STANDARD

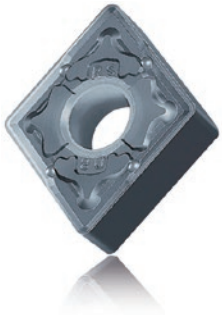
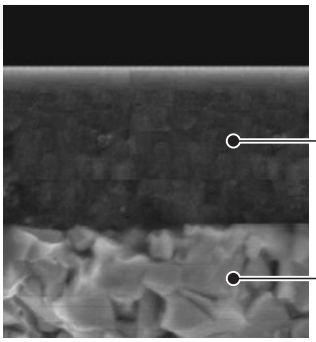
ISO Turning Inserts for Difficult to Cut Materials

NEW MP9005/MP9015/MP9025





ISO Grade	Grade	Concept	Application
S01	**MP9005**	Top-quality grade focusing on wear resistance	Heat Resistant Alloy Finish-Medium Cutting
S10	**MP9015**	First recommendation for general applications	Heat Resistant Alloy Medium-Rough Cutting
S30	NEW **MP9025**	Prevents severe damage for increased stability	Heat Resistant Alloy Interrupted • Light-Rough Cutting

CERMET

- The optimized alloy structure and special alloy binder improves both wear and fracture resistance.
- It covers a wide application range and reduces the number of tools required.
- NX3035 for wet cutting.
- NX2525 for dry cutting.

■SELECTION STANDARD

●TURNING

Work Material		Cutting Mode	Recommended Grade	Recommended Cutting Speed (SFM)	ISO		Application Range
P	Steel	Continuous Cutting	**NX2525**	720 (590 ─ 820)	P	10	NX2525
		Interrupted Cutting	**NX3035**	655 (620 ─ 850)		20	NX3035
K	Cast Iron Ductile Cast Iron	Finishing	**NX2525**	590 (490 ─ 690)	K	10	NX2525
						20	

■GRADE CHARACTERISTICS

Grade	Hardness (HRA)
NX2525	92.2
NX3035	91.5

Note 1) Hardness shows representative value of the substrate.

COATED CERMET

●Coated cermet (PVD coating) has superior wear and fracture resistance, and therefore provides a stable cutting performance.

■SELECTION STANDARD

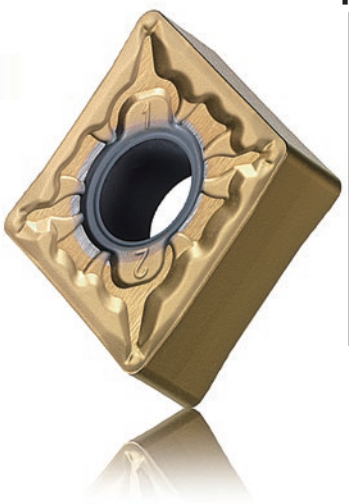
●TURNING

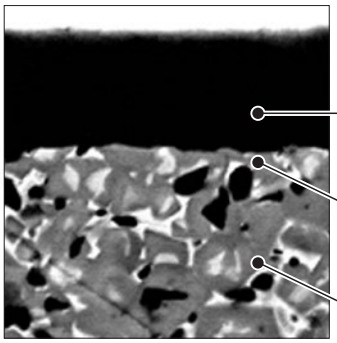
Work Material		Cutting Mode	Recommended Grade	Recommended Cutting Speed (SFM)	ISO		Application Range
P	Steel	Continuous Cutting	**VP25N** **AP25N**	785 (620 — 950)	P	10 20 30	VP25N, AP25N, MP3025
		Interrupted Cutting	**MP3025**	755 (590 — 920)			
K	Cast Iron Ductile Cast Iron	Finishing	**VP25N** **AP25N**	525 (360 — 755)	K	10 20	VP25N, AP25N

Effective for production of small parts.

MP3025

MP3025 provides improved adhesion for coating layer due to the newly-developed special substrate. Uniform flank wear allows prolonged machining that maintains excellent surface finish.





Ti-compound PVD coating provides excellent wear and welding resistance.

Substrate surface provides excellent adhesion strength for coating layer.

Substrate with superior fracture resistance and thermal shock resistance.

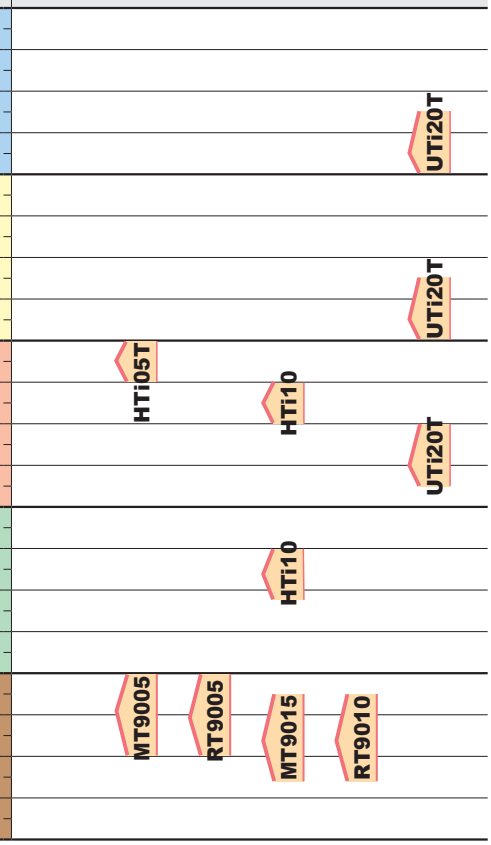
CEMENTED CARBIDE

●UTi grades are available for steel and cast iron. HTi grades are available for non-ferrous and non-metal materials and are also suitable for cast iron.

■SELECTION STANDARD

●TURNING

	Work Material	Recommended Grade	Recommended Cutting Speed (SFM)
P	Steel	**UTi20T**	330 (195 — 425)
M	Stainless Steel	**UTi20T**	330 (195 — 425)
K	Cast Iron	**HTi05T**	395 (260 — 490)
		HTi10	330 (165 — 490)
		UTi20T	330 (165 — 490)
N	Non-Ferrous Metal	**HTi10**	985 (330 — 1970)
S	Heat Resistant Alloy Ti Alloy	**MT9005 RT9005**	230 (165 — 330)
		MT9015 RT9010	195 (130 — 260)



■MAIN COMPONENT AND APPLICATION

ISO	Main Component	Characteristics	Work Material
P M	WC-TiC-TaC-Co	Heat / deformation resistance.	Carbon steel, alloy steel, stainless steel and cast iron
K N	WC-Co	High rigidity and wear resistance.	Cast iron, non-ferrous metals, and non-metal
S	WC-Co	High heat resistance and wear resistance.	Heat resistant alloy, Ti alloy

■GRADE CHARACTERISTICS

ISO	Grade	Hardness (HRA)
P M	**UTi20T**	90.5
K N	**HTi05T**	92.5
	HTi10	92.0
S	**MT9005/RT9005**	92.2
	MT9015/RT9010	92.0

Note 1) Hardness shows representative value of the substrate.

MICRO-GRAIN CEMENTED CARBIDE

● Compared to general cemented carbide, micro-grain alloy has higher wear resistance and higher toughness.

SELECTION STANDARD

Cutting Tool	Recommended Grade	Work Material
Turning Inserts Milling Inserts Carbide Drills	**TF15**	Steel Cast Iron

GRADE CHARACTERISTICS

Grade	Grade Characteristics *		ISO	Wear Resistance	Fracture Resistance	Corrosion Resistance
	Hardness (HRA)	T.R.S (Gpa)				
TF15	91.0	4.0	K20	◎	○	◎

* After HIP
Note 1) Hardness shows representative value of the substrate.

Light Cutting	M Class	LP	**Recommendation for light cutting of carbon steel and alloy steel** Double sided chipbreaker. Stable chip control in light cutting range. The curved edge allows smooth chip discharge.			LM	**Recommendation for light cutting of stainless steel** Double sided chipbreaker. Stable chip control in light cutting range. Breaker with high rake angle provides excellent burr control.			LK	**Recommendation for light cutting of cast iron** Narrow positive land provides low cutting resistance and excellent finish.			LS	**Recommendation for light cutting of difficult-to-cut materials** Enhanced chip disposal for depth of cut smaller than the corner R.			SH	**Recommendation for light cutting of carbon steel, alloy steel and stainless steel** Double sided chipbreaker. Can be used at low depth of cuts and high feed rates. The curved edge allows smooth chip discharge. Recommended for workpieces in the 160−250HB range.			SA	**Alternative breaker for light cutting of carbon steel and alloy steel** Double sided chipbreaker. Superior chip control at small depth of cuts. Covers copying and back turning with wavy edge. Recommended for workpieces in the 200−300HB range.			SW	**Wiper insert for light cutting of carbon steel and alloy steel** Double sided chipbreaker. The wiper allows up to two times higher feed. Wiper design for increased productivity and improved surface finish.			SY	**Recommendation for light cutting of mild steel** Double sided chipbreaker. Effectively controls chips. Recommended for workpieces in the 200−300HB range.			C	**Alternative breaker for light cutting of carbon steel and alloy steel** Double sided chipbreaker. Can be used at small depth of cuts. The curved edge allows smooth chip discharge.

CLASSIFICATION

NEGATIVE INSERTS WITH HOLE

Application	Tolerance	Breaker Name and Picture	Features	Cross Section Geometry	
Light Cutting	M Class	R/L 1G 	**Alternative chipbreaker for light cutting of carbon steel and alloy steel** Double sided chipbreaker. Angled chipbreaker controls chip flow. Excellent chip control at low to medium feed rates.		
Light Cutting	G Class	R/L K 	**Light cutting** Double sided chipbreaker. Parallel chipbreaker. Excellent chip control at low to medium feed rates.		
Light Cutting	M Class	MJ	**Recommendation for light cutting of difficult-to-cut materials** Double sided chipbreaker. Ideal for heat-resistant alloy and titanium alloy. The sharp edge produces excellent surface finishes. The curved edge allows smooth chip discharge.		
Light Cutting	G Class	MJ	**Recommendation for light cutting of difficult-to-cut materials** Double sided chipbreaker, Single sided chipbreaker. G class insert tolerance is suitable for workpieces requiring close dimensional tolerances. Ideal for heat-resistant alloy and titanium alloy. The sharp edge produces excellent surface finishes.		
Medium Cutting	M Class	MP	**Alternative breaker for medium cutting of carbon steel and alloy steel** Double sided chipbreaker. Suitable for medium to light cutting. Breaker geometry appropriate for copying and back turning. Good balance of sharpness and strength.		
Medium Cutting	M Class	MM	**Breaker with high rake angle reduces burr formation** Double sided chipbreaker. Simulation analysis technology assisted in the development of an optimized cutting edge land geometry, preventing plastic deformation and extending tool life.		
Medium Cutting	M Class	MK	**Recommendation for medium cutting of cast iron** Optimum balance between sharpness and high edge strength for general use.		
Medium Cutting	M Class	GM	**Alternative chip breaker for light to medium cutting of stainless steel** Double sided chipbreaker. Alternate chip breaker to main chip breakers LM and MM. Excellent notch wear resistance for light to medium cutting.		
Medium Cutting	M Class	GK	**Recommendation for rough cutting of cast iron** Positive land increases welding resistance and suppresses chip welding and abrasion at low speed cutting.

Application	Tolerance	Breaker Name and Picture	Features	Cross Section Geometry	
Finish Cutting	M Class	FP	**Recommendation for finishing carbon steel and alloy steel** Chip breaker peninsula controls chips even at small depth of cut. Maintains the edge strength at the corner and prevents sudden fractures.	Carbon Steel·Alloy Steel  	CCMT32.51FP
		FM	**Recommendation for finishing stainless steel** Chip breaker peninsula controls chips even at small depth of cut. Maintains the edge strength at the corner and prevents sudden fractures.	Stainless Steel  	CCMT32.51FM
		FV	**Recommendation for finishing carbon steel, alloy steel and mild steel** Sharp cutting edge and low resistance design provides excellent cutting performance. Suitable for low depth of cut and feed rate applications.	Carbon Steel·Alloy Steel  	CCMT32.51FV
		SVX	**Alternative chipbreaker for light cutting of carbon steel and alloy steel** Chip control is improved by having a chip breaker geometry suitable for copying.	Carbon Steel·Alloy Steel  	XCMT221SVX
	G Class	FS	**Recommendation for finishing difficult-to-cut materials** Ideal for heat-resistant alloys, titanium alloys, and cobalt chrome alloys. Sharp cutting edges provide excellent surface precision and finish. Highly efficient chip discharge is possible due to curved cutting edges.	Difficult-to-Cut Materials  	CCGT32.50.5FS
		FS-P	**Recommendation for finishing titanium alloy** Ideal for titanium alloys and copper alloys. Sharp cutting edges provide excellent surface precision and finish. Highly efficient chip discharge is possible due to curved cutting edges. Polished (mirror-surface) finish of insert surfaces drastically improves welding resistance extending tool life.	Titanium alloy  	CCGT32.50.5FS-P
		FJ 	**Recommendation for finishing difficult-to-cut materials** The curved cutting edges support changes in cutting depth and allow smooth chip discharge and disposal. The high rake angle is highly suitable for finishing difficult-to-cut materials.	Difficult-to-Cut Materials  	CCGT32.50.5FJ
		FJ-P	**Finishing titanium alloy** Ideal for aluminum and copper. The sharp edge produces excellent surface finishes. The curved edge allows smooth chip discharge. The polished insert face prevents built up edge.	Titanium alloy  	CCGT32.50.5FJ-P
		AZ	**Recommendation for aluminum alloy** The high rake angle and 3D curved cutting edge provides sharpness at the cutting point. Additionally the 3D shape of the rake face enables excellent chip control. The polished insert face prevents built up edge.	Aluminum Alloy  	DCGT32.50.5AZ

HOW TO READ THE STANDARD OF CBN & PCD TURNING INSERTS

●How this section page is organized

①Organized according to turning insert shape.
(Refer to the index on the next page.)

②Inserts are arranged in order of :

- Negative inserts (with hole→without hole)
- Positive inserts (with hole→without hole)

GRADE APPLICATION RECOMMENDED FOR EACH WORK MATERIAL
cutting conditions suitable for each type of work material is shown as a general guide to select the grade.

●: Stable Cutting ◐: General Cutting ✠: Unstable Cutting

CLASSIFICATION OF CBN & PCD GRADES

FEATURES

NON-COATED CBN MATERIALS

CBN sintered materials base cutting tools are produced by binding CBN (Cubic Boron Nitride) and ceramic having hardness next to diamond and sintering under ultra-high pressure and high temperature.
CBN has lower affinity to iron than diamond. The low affinity and high hardness properties means that sintered CBN delivers a superior cutting performance especially during high speed machining of materials such hardened steel, cast iron and sintered alloys etc.

COATED CBN MATERIALS

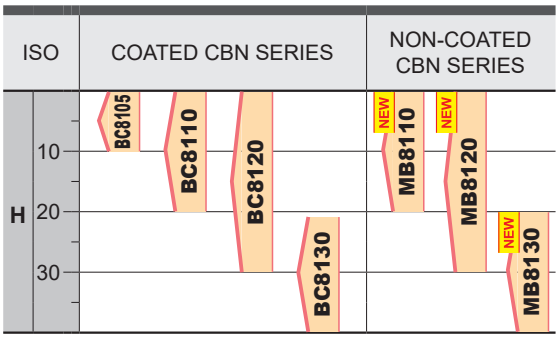
To achieve longer tool life, Mitsubishi uses a unique "Particle-activated Sintering Method", combined with increased cutting edge strength. With high crater wear resistance CBN grades and a wear resistant ceramic coatings, longer tool life and improved machine efficiency are obtained.

PCD MATERIALS (Sintered Diamond)

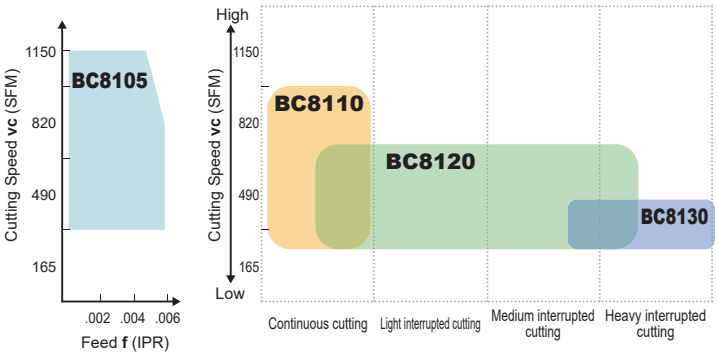
Suitable for cutting materials such as nonferrous metals and fiber reinforced plastics (FRP) including aluminum alloys.
It supports ultra high speed finish cutting.

■ Work Materials for Turning Grades/Application Area

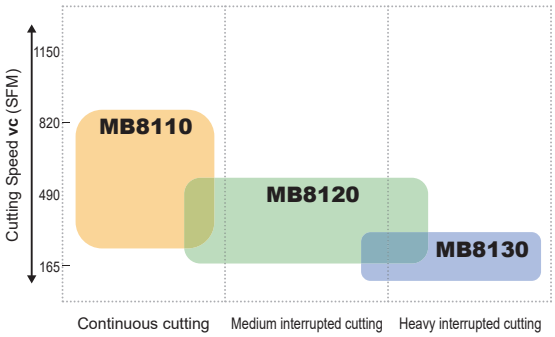
●Hardened Materials



COATED CBN MATERIALS



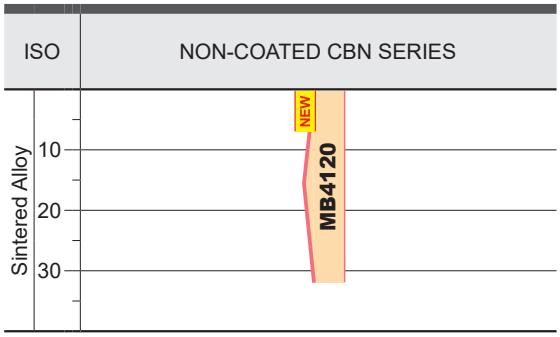
NON-COATED CBN MATERIALS

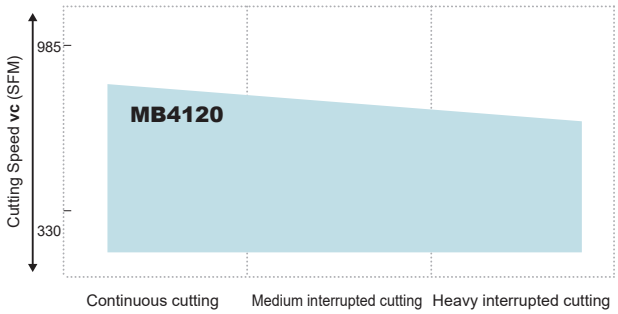


Suitable for finishing with surface roughness Ra .024 µinch or Rz .094 µinch or less.

Coated CBN Grade BC8100 and Non-coated CBN Grade MB8100 for high-hardness steel processing are available in a wide range of areas from finishing to continuous cutting of hardened steels and strongly interrupted machining.

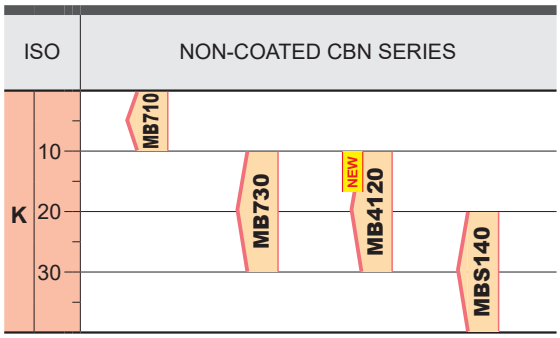
●Sintered Alloy

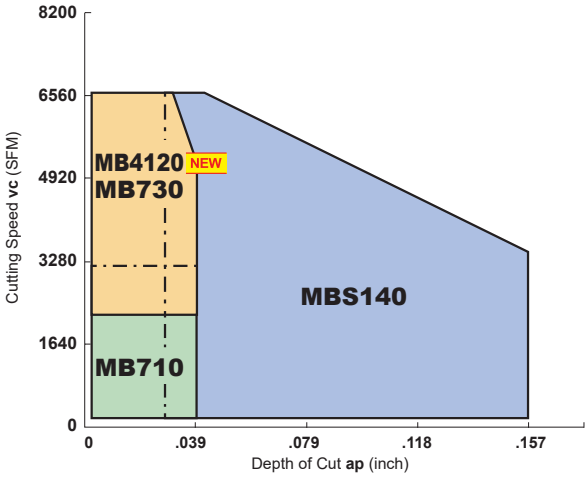




The CBN grade “MB4120” for sintered alloy and cast iron cutting can be used widely from continuous cutting to interrupted cutting in the processing of cast irons such as sintered alloys for valve mechanism parts and oil pump parts.

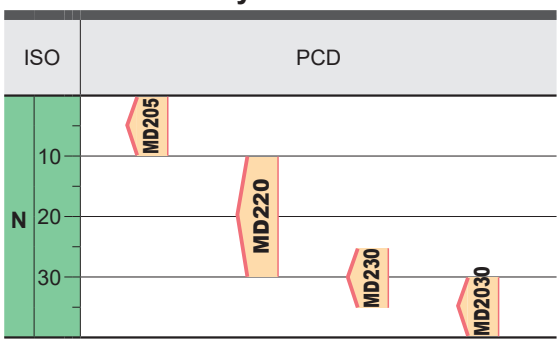
●Cast Iron

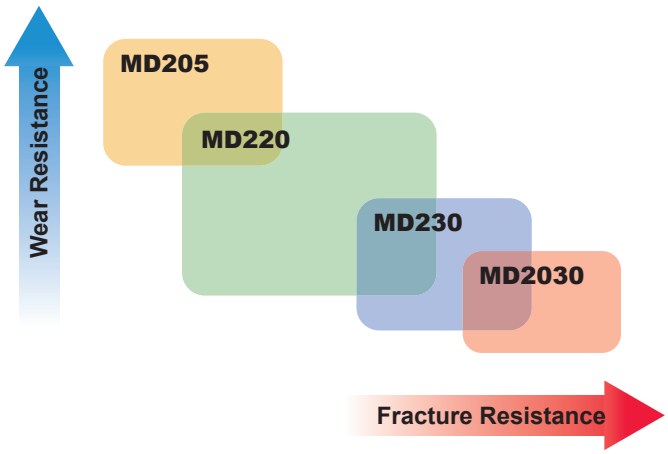




Lineup of grades available from general cutting to deep depth cutting for high efficiency machining.

●Aluminum Alloy





Suitable for cutting materials such as nonferrous metals and fiber reinforced plastics (FRP) including aluminum alloys.
It supports ultra high speed finish cutting.

COATED CBN

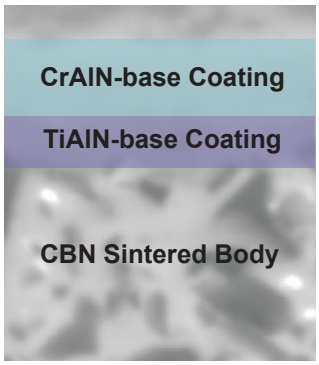
BC8100 series for machining of hardened steel

FEATURES

The coated CBN grade BC8100 series and non-coated CBN grade MB8100 series for cutting of hardened steel uses newly developed optimized substrate technology CBN base material. The new ultra-micro-binder prevents sudden fracturing and longer tool life. The BC8100 series coating exhibits excellent fracture resistance and wear resistance by using a special PVD coating suitable for each cutting mode.

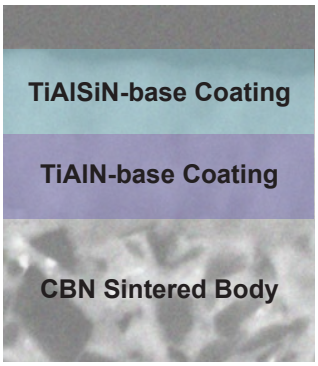
■ Newly Developed Special PVD Coating

BC8105



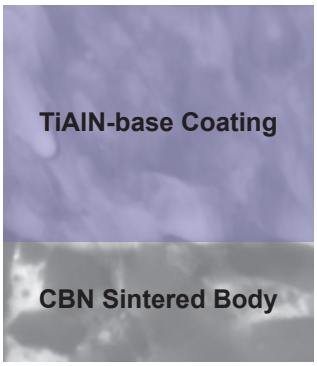
Offers excellent surface finishes.
Peeling resistance and adhesion strength are improved by having both lubricity and wear resistance.

BC8110



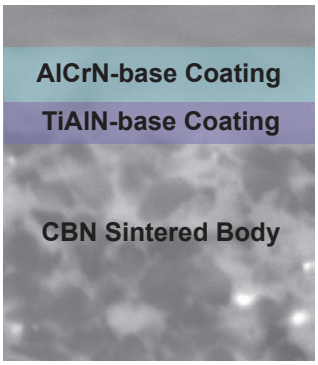
Chipping caused by built up edge is prevented with improved welding resistance.
Improved wear and adhesion strength to the CBN surface.

BC8120



Chipping caused by built up edge is prevented with improved welding resistance.
Improved adhesion to the coating to the CBN surface enhances peeling resistance.
The CBN is also improved in toughness by adopting new binder and sintering method.

BC8130

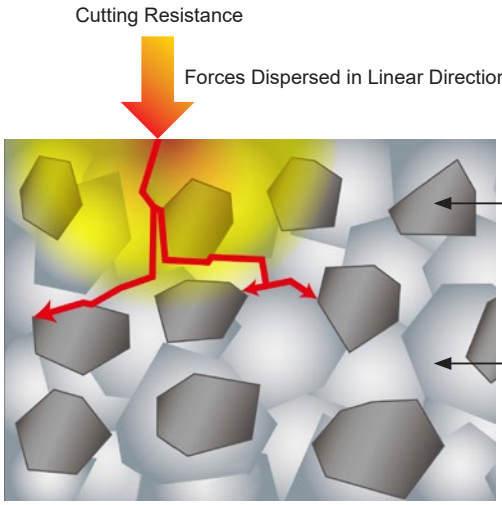


Peeling caused by severe impact and chipping are prevented with high fracture resistances.
Improved adhesion strength to the CBN surface.

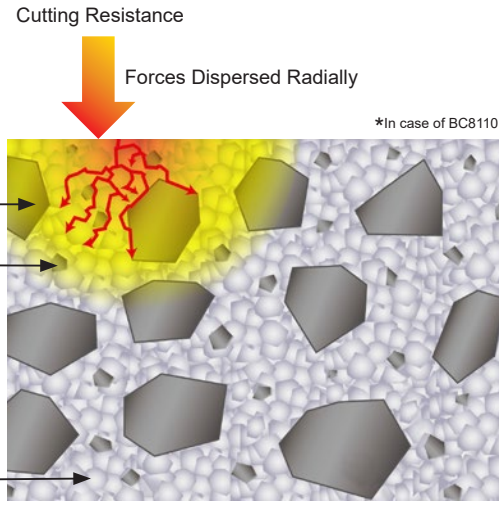
*Graphical representation.

■ The newly developed Ultra Micro-particle Binder prevents sudden fracture

●Conventional



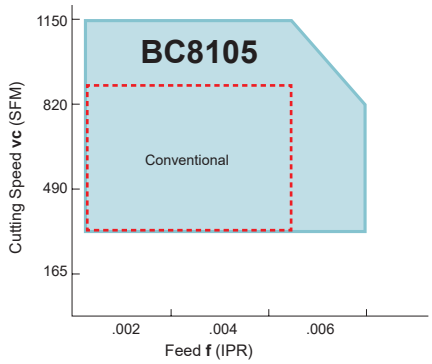
●BC8100 Series



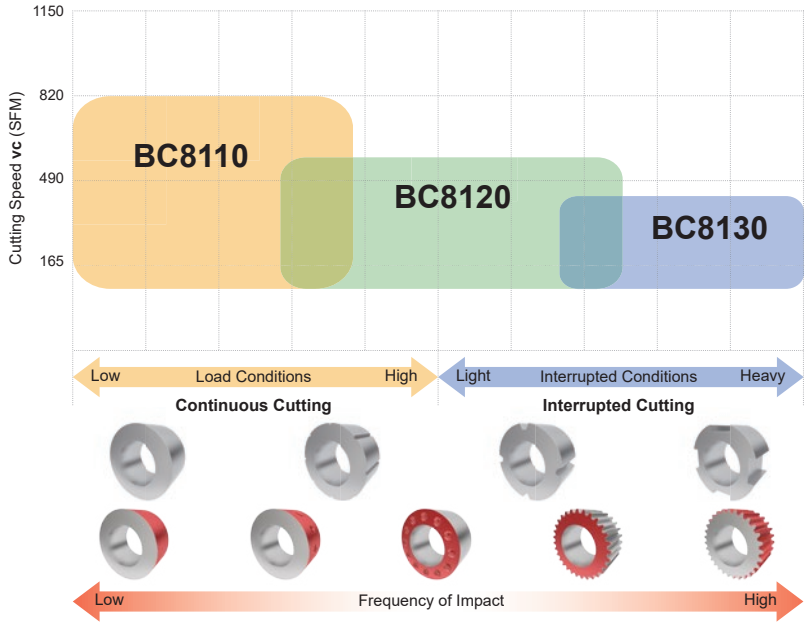
Medium Grain CBN
Micro Grain CBN
Binder Macroparticles
Ultra Micro-particle Binder

Dispersal of the newly developed Ultra Micro-particle Binder for sintered CBN and Micro Grain CBN suppresses cracking to prevent sudden fracturing.

Application Range



*BC8110 is recommended to improve wear resistance.



Recommended Cutting Conditions

Grade		Cutting mode	Cutting Speed vc (SFM) 165 – 490 – 820 – 1150	Feed f (IPR)	Depth of Cut ap (inch)	Cutting Mode
BC8100 Series	BC8105	Continuous		≤.006	≤.008	Dry, Wet
	BC8110	Continuous		≤.008	≤.014	Dry, Wet
	BC8120	Continuous		≤.012	≤.020	Dry, Wet
		Interrupted		≤.008	≤.012	Dry, Wet
	BC8130	Interrupted		≤.008	≤.012	Dry, Wet

COATED CBN

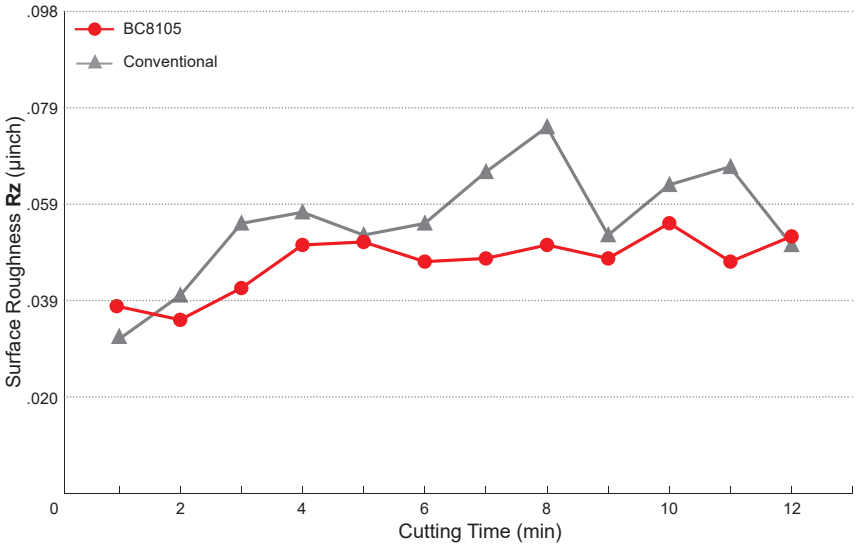
BC8100 series for machining of hardened steel

■ Cutting Example and Application Example

BC8105 Highest Accuracy

CBN substrate with excellent wear resistance and chipping resistance, together with a high-lubricity coating film, controls the occurrence of boundary wear and exhibits outstanding surface finish.

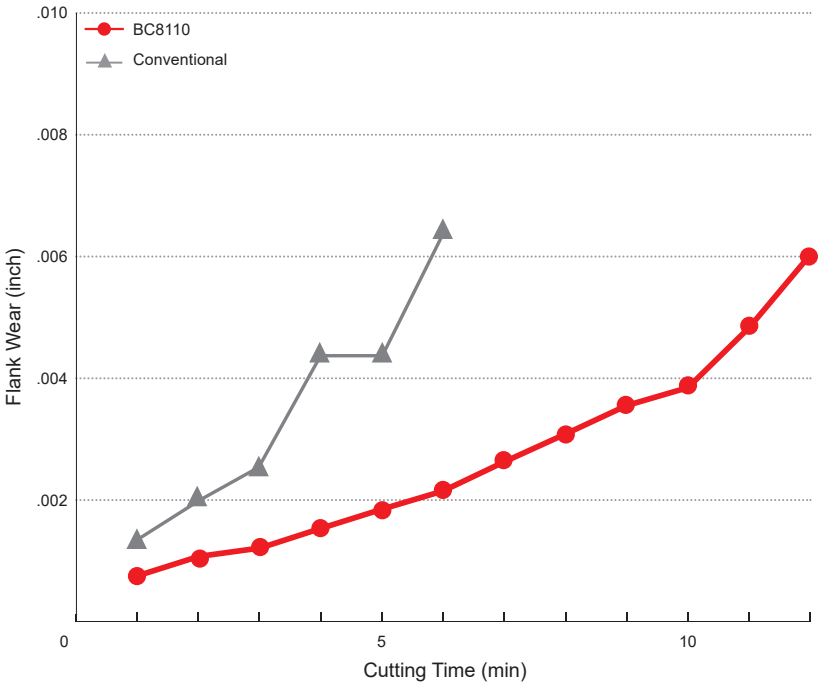
Suitable for finishing with surface roughness Ra .024 µinch or Rz .094 µinch or less.



Insert	NP-CNGA432-GS2
Work Material	AISI 5120 (60HRC)
Machining Methods	External Continuous Cutting
Cutting Speed **vc** (SFM)	655
Feed **f** (IPR)	.002
Depth of Cut **ap** (inch)	.002
Cutting Mode	Dry Cutting

BC8110 High Speed Turning

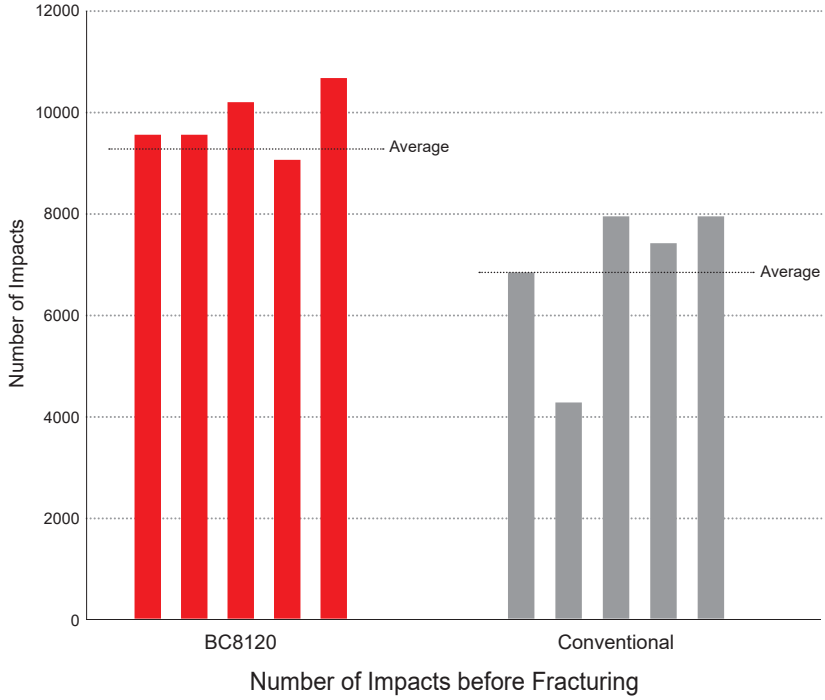
CBN substrate with excellent wear resistance and chipping resistance, together with an extremely hard coating film, provides the highest flank wear resistance of the entire BC8100 series.



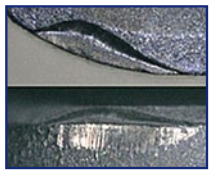
Insert	NP-CNGA432-GS2
Work Material	AISI 5120 (60HRC)
Machining Methods	External Continuous Cutting
Cutting Speed **vc** (SFM)	820
Feed **f** (IPR)	.004
Depth of Cut **ap** (inch)	.008
Cutting Mode	Dry Cutting

BC8120 General Application

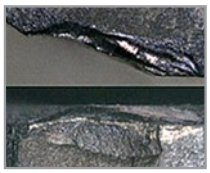
CBN substrate with excellent fracture resistance and crater wear resistance, together with a coating film having superior wear resistance, combines both fracture resistance and wear resistance while exhibiting outstanding crater wear resistance.



Cutting Edge Condition after 8000 Impacts



BC8120

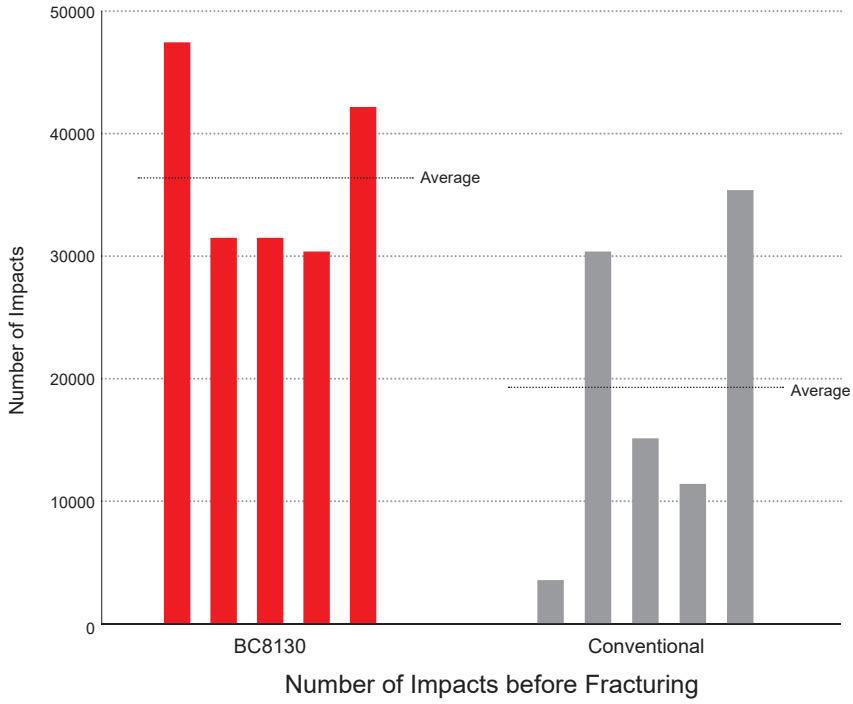


Conventional

Insert	NP-CNGA432-GA2
Work Material	AISI 5120 (60 HRC)
Machining Methods	External Interrupted Cutting
Cutting Speed **vc** (SFM)	820
Feed **f** (IPR)	.006
Depth of Cut **ap** (inch)	.004
Cutting Mode	Dry Cutting

BC8130 Tough Machining

CBN substrate with excellent cutting edge strength, together with a coating film that combines hardness with impact resistance, allows it to exhibit outstanding cutting edge strength and fracture resistance.



Insert	NP-CNGA432-GA2
Work Material	AISI 5120 (60 HRC)
Machining Methods	External Heavy Interrupted Cutting
Cutting Speed **vc** (SFM)	820
Feed **f** (IPR)	.002
Depth of Cut **ap** (inch)	.004
Cutting Mode	Wet Cutting

NON-COATED CBN

MB8100 series for machining of hardened steel

FEATURES

The MB8100 series CBN base material uses the optimized substrate technology (see B006) applied to the BC8100 series to prevent sudden defects during cutting and achieve long life.
The MB8100 series has a lineup of MB8110 for continuous cutting, MB8120 for general cutting, and MB8130 for interrupted cutting, and can be used in a wide range of cutting applications.

■ Application Range

MB4120

●The first recommendation that can be widely used for continuous to interrupted cutting of sintered alloy and cast iron.

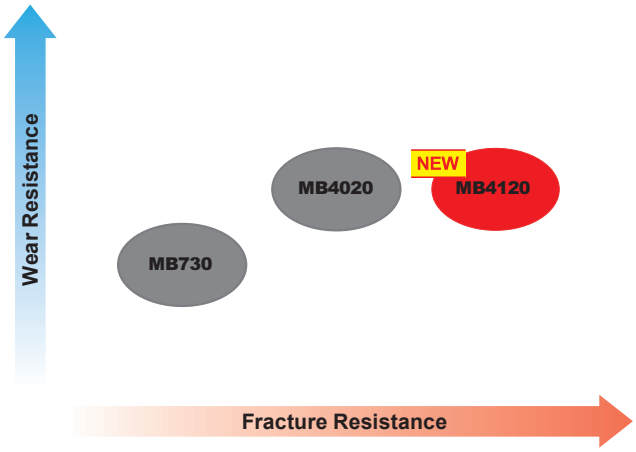
FEATURES

High Fracture Resistance

Fine CBN particles increase cutting edge toughness. The high fracture resistance allows stable performance even during interrupted machining.

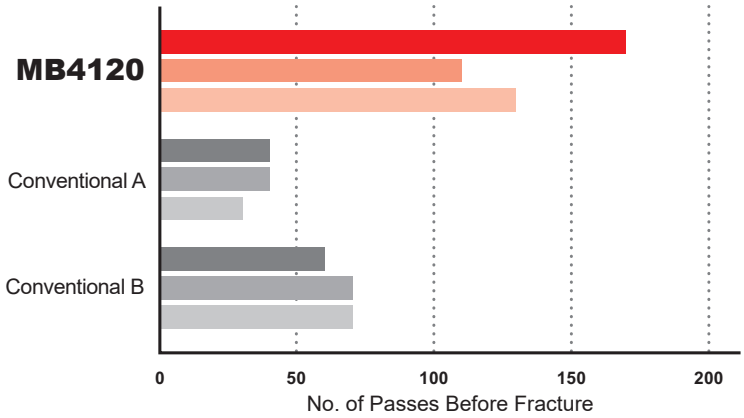
High Adhesion Strength of Fine CBN Particles

Optimization of the sintering conditions strengthens adhesion between fine CBN particles. This increases both fracture resistance and wear resistance.



■ Application Example

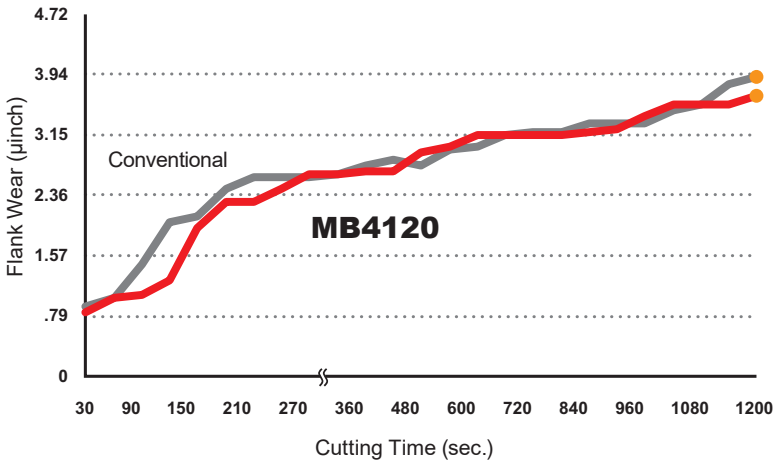
Fracture Resistance Comparison During Interrupted Facing of High Strength Sintered Alloy

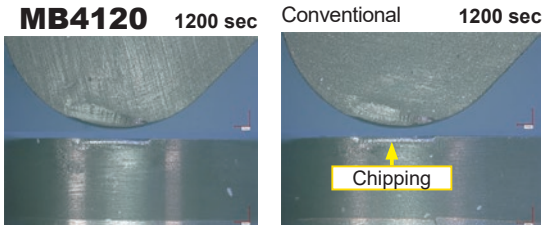


<Cutting Conditions>
Work Material : High Strength Sintered Alloy
Insert : NP-TNGA332-SE3
Cutting Speed : vc=490 SFM
Feed : f=.006 IPR
Depth of Cut : ap=.004 inch
Cutting Mode : Wet Cutting

Excellent chipping resistance in interrupted face cutting of gear.

Comparison in Continuous Machining of AISI No 35 B





<Cutting Conditions>
Work Material : AISI No 35 B (Perlite)
Insert : NP-TNGA332-SF3
Cutting Speed : vc=2625 SFM
Feed : f=.004 IPR
Depth of Cut : ap=.008 inch
Cutting Mode : Dry Cutting

It has excellent fracture resistance as compared to conventional products.

SOLID CBN

Cast Iron Machining MBS140

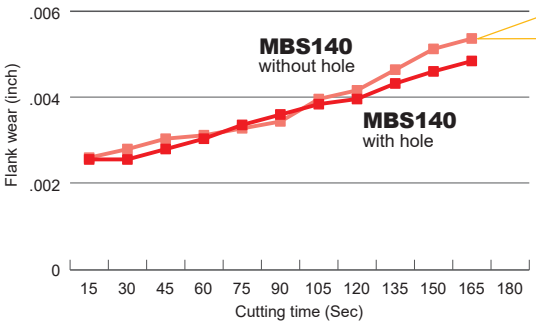
FEATURES

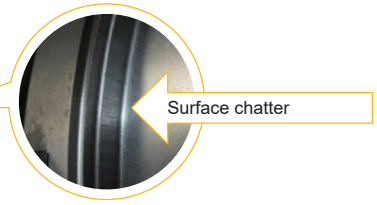
Supports high-efficiency machining with large depths of cut.

Since all inserts are CBN sintered bodies, there are no limits to the depths of cut as with CBN brazing tools, allowing machining with large depths of cut. For rough machining of cast iron, high-speed, high-efficiency machining, which is a characteristic of CBN tools, can be achieved.

Combines wear resistance and fracture resistance

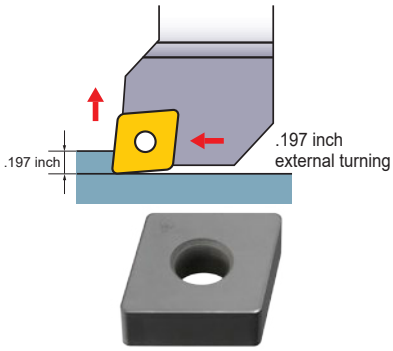
Use of micro-grain CBN with a newly-developed special binder provides high wear resistance.
Use of Mitsubishi's original high-efficiency sintering technology provides high fracture resistance and supports machining with large depths of cut.





<Cutting Conditions>
Work material : AISI No 35 B
Insert : CNGA432/CNGN432
Holder : Double Clamp Holder
Cutting Speed : vc=1310 SFM
Feed : f=.002 IPR
Depth of Cut : ap=.197 inch
Cutting Mode : Wet Cutting

Addition of insert series equipped with holes
Comparison of depth of cut
5mm face turning



CBN

FOR CYLINDER LINER MB5015

***Produce to order only.**

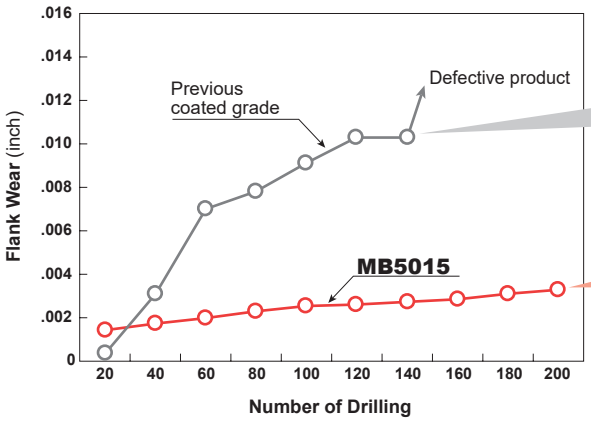
FEATURES

MB5015 is exclusive grade for boring of Centrifugal casting Cylinder liners in semi finishing or finishing applications with high wear resistance.

■ Recommended Cutting Conditions

Work Material		Cutting Mode	Cutting Speed vc (SFM) 330 1640 3280 4920	Feed f (IPR)	Depth of Cut ap (inch)	Cutting Mode
Centrifugal casting	Cast Iron	Continuous cutting		–.012(Finishing) –.031(Semi-finishing)	–.002(Finishing) –.008(Semi-finishing)	Wet Cutting

■ Cutting Performance



<Cutting Conditions>
Work material : AISI No 30 B
(Centrifugal casting) ϕ2.48"
Cutting Speed : vc=2625 SFM
Feed : f=.014 IPR
Depth of Cut : ap=.001 inch
Compornent : Centrifugal casting Cylinder liner
Hole Depth : 3.94 inch

CBN

- Suitable for high speed finishing of heat treated steel, sintered ferrous alloy and cast iron.
- Low affinity to iron, thus good surface finishes are possible.
- Grinding can be replaced by machining.

●Heat Treated Steel

Work Material		Type	Cutting Mode	Recommended Grade	Recommended Cutting Conditions			
					Cutting Speed vc (SFM)	Feed f (IPR)	Depth of Cut ap (inch)	Cutting Mode

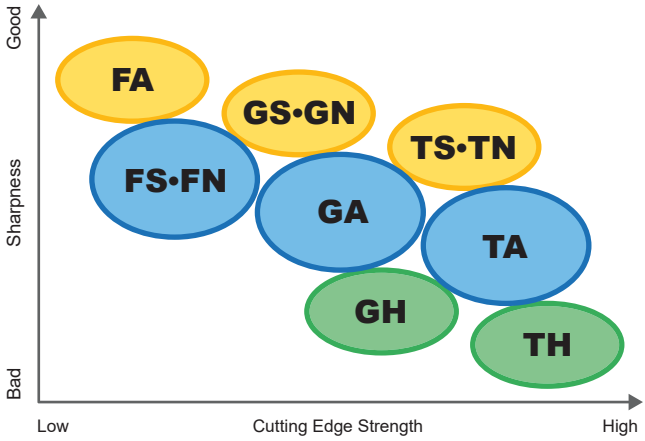
HONING

Honing for Machining Hardened Steel



● General cutting

GA Honing : General machining
GS Honing : Vibration and burr control
GN Honing : If the crater wear is large.
GH Honing : For depths of cut of .006 inch or greater

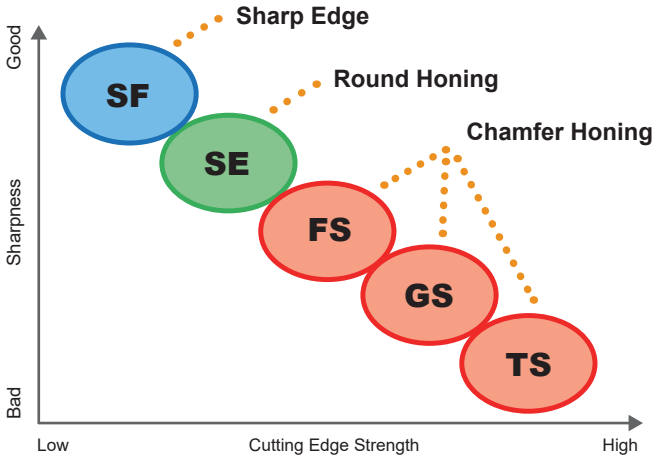
● Continuous cutting, Stable cutting

FS Honing : General machining
FA Honing : For improved biting compared to **FS**
FN Honing : if the crater wear is large.

● Medium and heavy interrupted cutting, Unstable cutting

TA Honing : General machining
TS Honing : Vibration and burr control
TN Honing : If the crater wear is large.
TH Honing : For depths of cut of .006 inch or greater

Honing for Machining Sintered Alloys



● Continuous cutting, Stable cutting

FS Honing : Continuous cutting, General machining

● Medium and heavy interrupted cutting, Unstable cutting

GS,TS Honing : If fracturing occurs at the blade edge during interrupted cutting

● Focus on high-precision cutting, dimensional precision, and surface roughness

SF Honing : Focus on finished surface roughness
SE Honing : If chipping occurs

NP-CNGA432-G A 2

CBN BREAKER INSERT

FEATURES

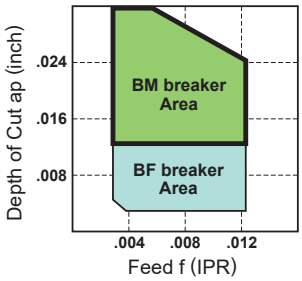
Chip Breaker Geometry Designed for Excellent Chip Control

Radial chip breaker ensures optimization of the cutting point and the chip breaker position. Enables effective chip discharge even when copy machining and prevents the chips from wrapping around the holder under finish cutting conditions.

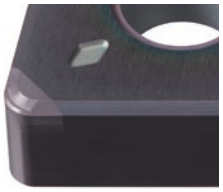
Long Life Coated CBN Grade

Combination of Coating grade & Breaker, high efficiency and long tool life in wide variety of applications.

■Application Area



■ BM Breaker (Deep shoulder Turning)

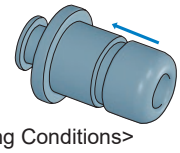


Good for deep depth cutting of carburized layer.

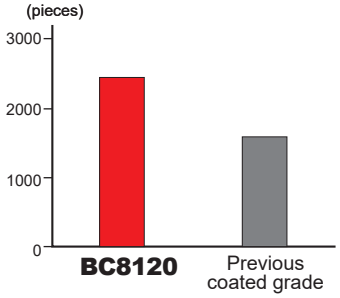
Recommend and under ap=.024 inch

Available in BC8120 grade.

●Cutting Performance

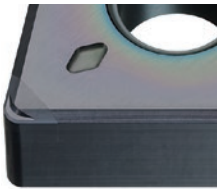


<Cutting Conditions>
Work Material : AISI 4142 (56-59HRC)
Component : Counter shaft (External interrupted cutting)
Insert : BM-DNGM442-TA2
Cutting Speed : vc= 555 SFM
Feed : f= .006 IPR
Depth of Cut : ap= .003 – .004 inch
Cutting Mode : Wet Cutting



BC8120 achieved 1.5X longer tool life.

■ BF Breaker (Light cutting depth)

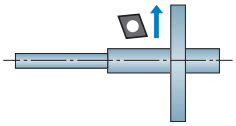


Good for chip removal under light depth and feed cutting.

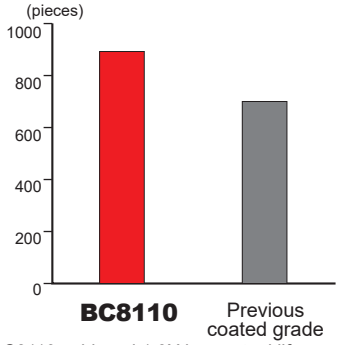
Recommend and under ap=.012 inch

Available in BC8110 grade.

●Cutting Performance



<Cutting Conditions>
Work Material : Hardened Steel (61-65HRC)
Component : Clutch shaft (Continuous facing)
Cutting Speed : vc=490 SFM
Feed : f=.005 IPR
Depth of Cut : ap=.006 inch
Wet Cutting



BC8110 achieved 1.3X longer tool life.

MULTI-CORNER TYPE INSERTS

●A single sided, multi-corner type insert has no cutting edges on the underside.

Double Sided, multi-corner type insert, ex.

NP-CNGA432-GA4

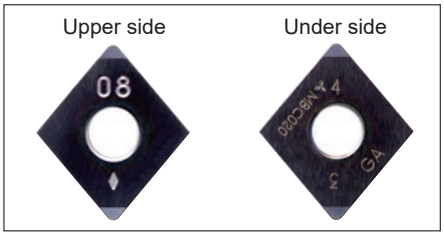
No. of Cutting Edge Corners

Single Sided, multi-corner type insert, ex.

NP-CNGA432-GA2

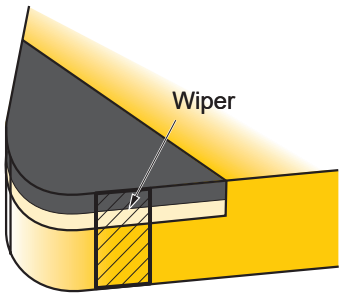
No. of Cutting Edge Corners

Double sided, Multi-corner type insert



WIPER INSERT

FEATURES



Improving Surface Finish

Under the same machining conditions as conventional breakers, but with the feed rate increased, the surface finish of the work material can be improved.

Improving Efficiency

High feed rates not only shorten machining times but also make it possible to combine roughing and finishing operations.

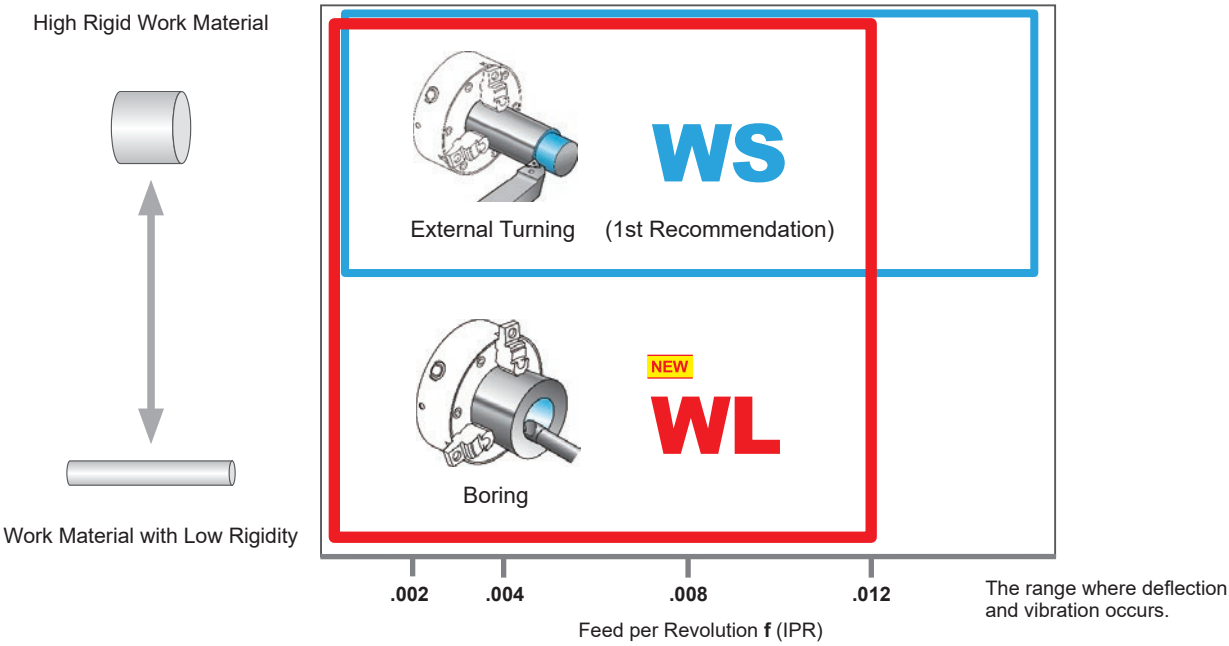
Increased Tool Life

When a change to high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing the tool life of the insert.

Improving Chip Control

Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.

■ Application of Wiper Inserts



NEW

■ WL Wiper Insert

Preventing the cutting edge from vibration during boring and turning of small diameter work material as well as providing excellent surface finish.

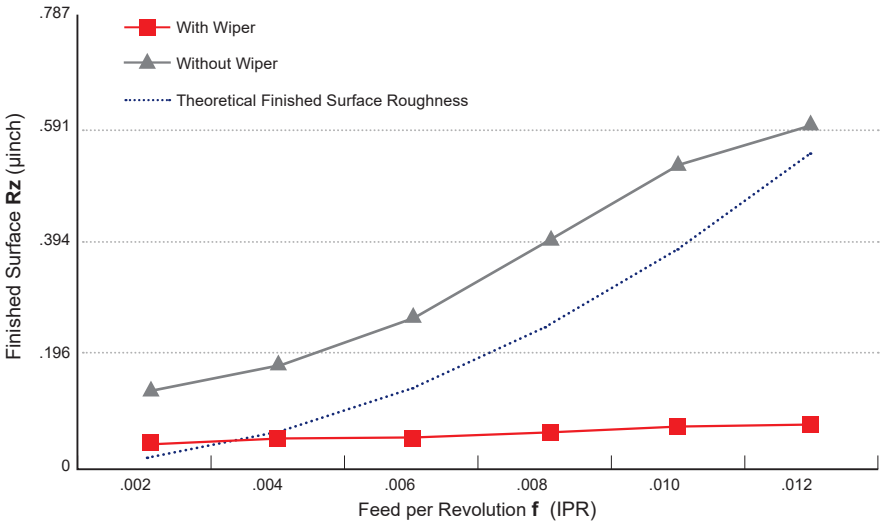
Inclination of the Wiper

The Optimum Wiper Width

Applying slight slope on the wiper cutting edge reduces cutting resistance.

Cutting Performance

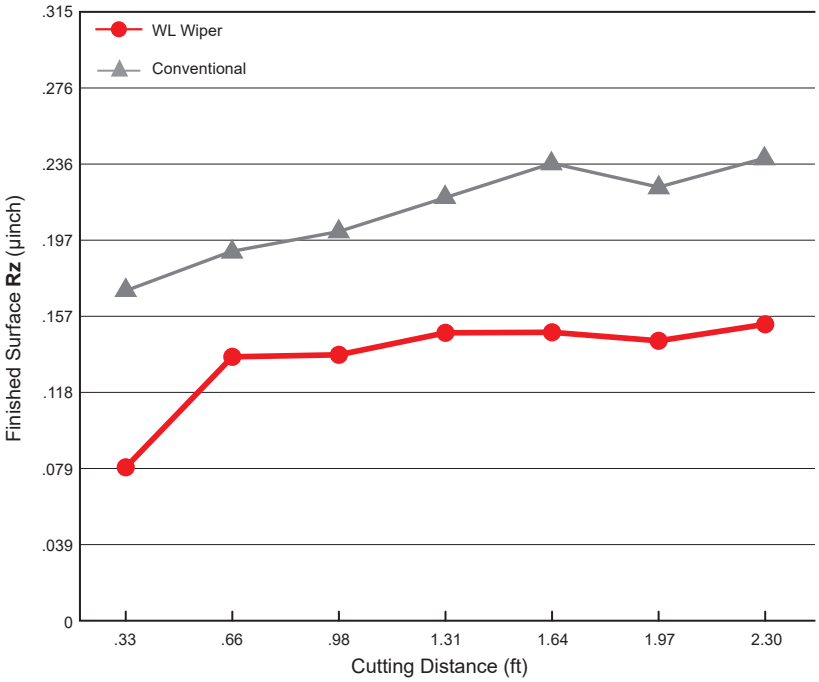
WL Wiper (External Turning)



<Cutting Conditions>
Work Material : Hardened Steel (60 HRC)
Insert : NP-CNGA432
Machining Methods : Continuous
Cutting Speed : vc=395 SFM
Depth of Cut : ap=.004 inch
Cutting Mode : Dry Cutting

NEW

WL Wiper (Boring)



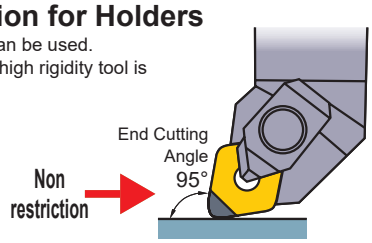
<Cutting Conditions>
Work Material : AISI 5115 (60HRC)
Insert : NP-CNGA432-FBWL2
Machining Methods : Continuous
Cutting Speed : vc=525 SFM
Feed : f=.012 IPR
Depth of Cut : ap=.004 inch
Cutting Mode : Dry Cutting

Stable surface finish is maintained even in unstable cutting.

Notes for Use

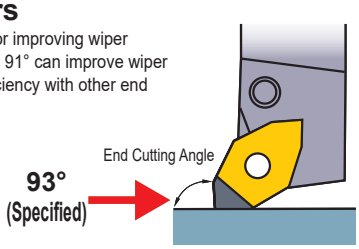
No Restriction for Holders

Standard holders can be used.
(*A double clamp, high rigidity tool is recommended.)



Restriction for Holders

Use a holder with end cutting angle 93° for improving wiper efficiency. A holder with end cutting angle 91° can improve wiper efficiency, however, there is no wiper efficiency with other end cutting angles (60°, 90°,107°etc.).



CBN GROOVING SERIES
(GY/MG)

FEATURES

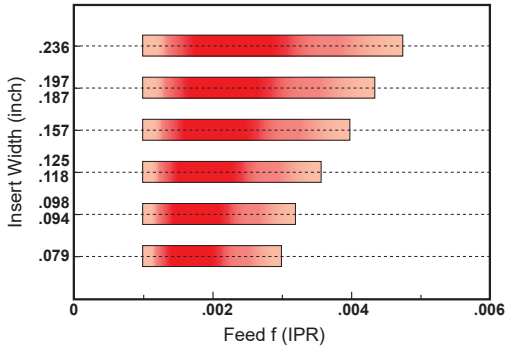
A CBN insert combined with a high rigidity holder ensures high accuracy and long tool life.

Holder rigidity is essential when grooving hardened steel. The GY series Tri Lock system offers high rigidity equivalent to a 1-piece type despite being a 2-piece type. MG has a wide insert location face for high gripping force. A CBN insert combined with these holders allows it to deliver excellent performance when grooving hardened steel.

BC8110 coated materials for continuous machining of hardened steel have been added to GY inserts.

BC8110 materials with excellent wear resistance have been added. Compared to conventional materials, they display excellent wear resistance to achieve long tool life. A blade width of .236" has also been added to the lineup of BC8110.

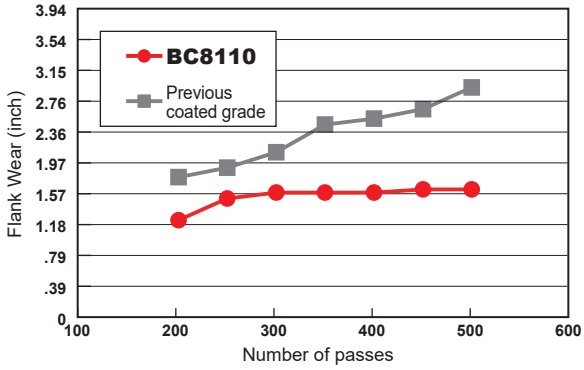
■ Recommended Cutting Conditions



Work Material		Hardness	Grade	Cutting Speed vc (SFM)	Cutting Mode
H	Hardened Steel	35－65HRC	**BC8110** **MB8025**	330 (195－395)	Dry,Wet

■ Cutting Performance

Tool life evaluation for the GY holder



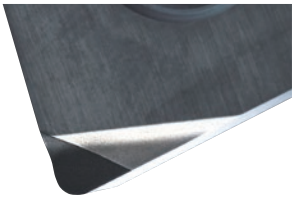
<Cutting Conditions>
Insert : GY1G0200D020N-GFGS
Work Material : Hardened Steel (60HRC)
Cutting Speed : vc=395 SFM
Feed : f=.004 IPR
Depth of Cut : ap=.012 inch
Cutting Mode : Dry Cutting

■ Application Example

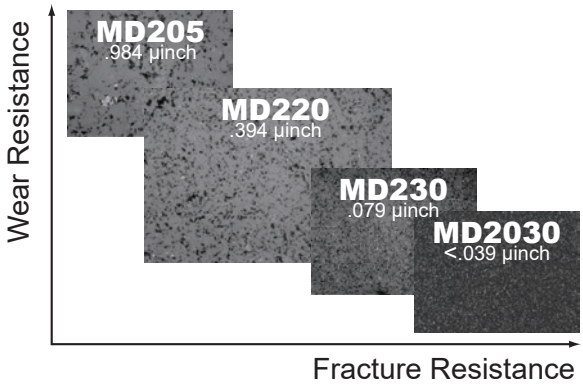
Insert		**GY1G0300F020N-GFGS** (Grade : **BC8110**)
Work Material		 Hardened Steel (58–62HRC)
Component		Input shaft
Cutting Conditions	Cutting Speed vc (SFM)	425
	Feed f (IPR)	.004
Result		 Tool life over twice as long as conventional products

PCD (SINTERED DIAMOND)

- Suitable for materials such as aluminum alloy, non-ferrous metals, and fibre strengthened plastic.
- Suitable for extremely high speed finishing.



FEATURES



Grade	Features
MD205	**For Continuous Cutting** Coarse grain diamond particles are sintered and wear resistance is excellent. Use when wear resistance with MD220 is insufficient.
MD220	**Materials for General Machining** Sintered medium grain diamond particles. Wear resistance and fracture resistance are superbly balanced. Applicable to general finishing of non-ferrous metals, non-metal cutting, and similar machining.
MD230	**For Interrupted Cutting** Fine grain diamond particles are used. Fracture resistance and cutting edge sharpness are excellent. Use when fracture and a high quality finished surface is demanded with MD220.
MD2030	**For Heavy Interrupted Cutting** Strong sintering of ultra micro-grain PCD particles provides exceptional fracture resistance. Chipping during high-speed finish turning can be controlled.

■ SELECTION STANDARD

TURNING

Work Material	Recommended Grade			Recommended Cutting Conditions		
	MD205	MD220	MD2030	Cutting Speed vc (SFM)	Feed f (IPR)	Depth of Cut ap (inch)
Aluminum Alloy (Si ≤ 12%)		◎	○	2625 (655—3935)	—.008	—.039
Aluminum Alloy (Si ≥13%)	◎	○		1970 (655—3280)	—.008	—.039
Copper Alloy		◎		2295 (655—3935)	—.008	—.039

Wood Inorganic Board		◎		4265 (985—13120)	—.016	—
Cemented Carbide	◎	○		50 (15—65)	—.008	—.020

Note1) ◎ : 1st recommendation. ○ : 2nd recommendation
Note2) Not suitable for steel.

■ NEW PETIT CUT INSERT SERIES

- **Economical** Low cost is achieved by reducing the area of the diamond sintered body. In addition, tool management is economical because regrinding is unnecessary.
- **With Breaker** Chip breaker formed directly on the PCD portion delivers superior chip control.
- Corner R.002" inserts are available, making it suitable for the machining of small work corner radii.

HOW TO READ THE STANDARD OF EXTERNAL TURNING TOOLS

●How this section page is organized

①Organized according to turning insert shape.
(Refer to the index on the next page.)

TYPE OF TOOL HOLDER
indicates the first four letters of the order number, as well as cutting applications.

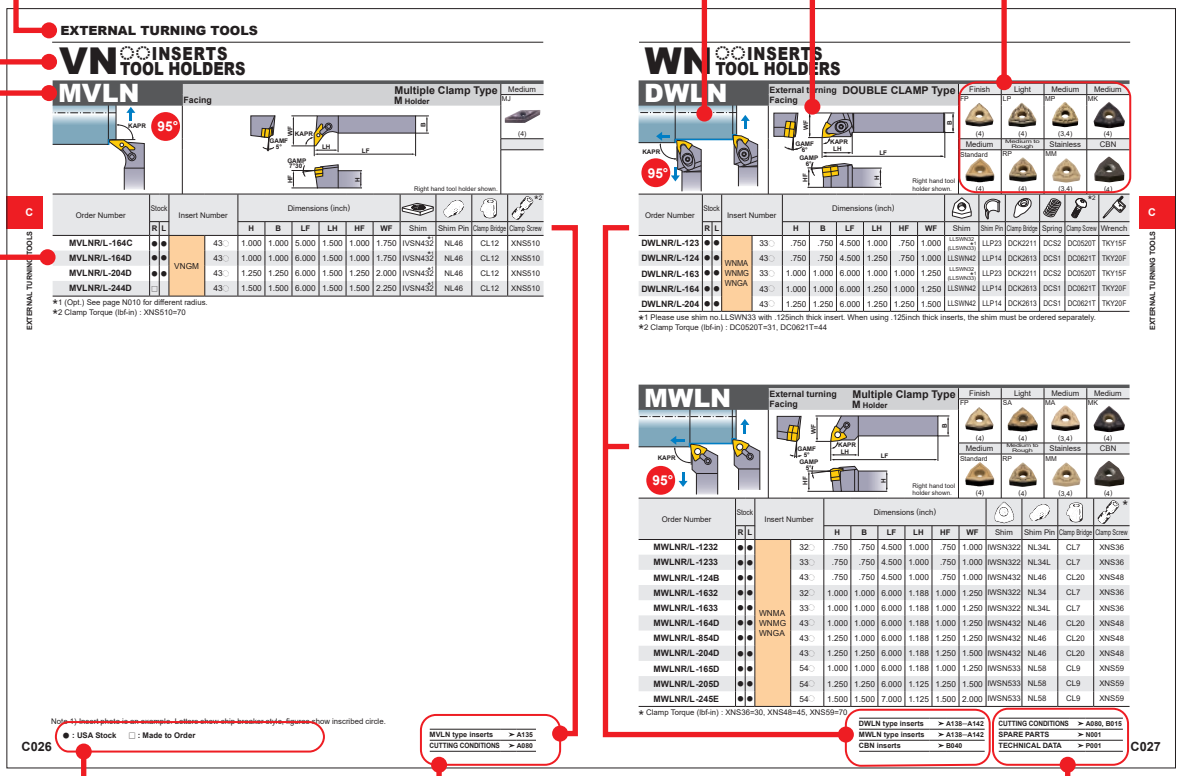
TITLE OF PRODUCT BY INSERT TYPE

PRODUCT SECTION

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict the available machining applications such as external turning, copying, facing, and chamfering together with cutting edge lead angles.

GEOMETRY

CHIP BREAKER BY CUTTING APPLICATION



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

REFERENCE PAGE FOR APPLICABLE INSERTS
indicates reference pages giving details of inserts that are applicable to the product.

PAGE REFERENCE
·SPARE PARTS
·TECHNICAL DATA
indicates reference pages, including the above, on the right hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, dimensions, and spare parts.

●To Order : Please specify order number and hand of tool (right/left).

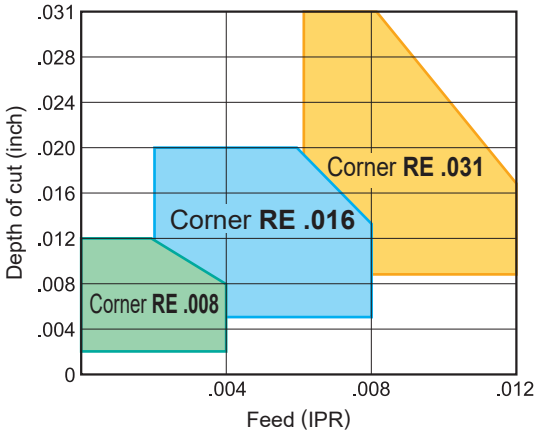
APPLICATION RANGE



RECOMMENDED CUTTING CONDITIONS

	Work Material	Hardness	Grade	Cutting Speed (SFM)
P	Mild Steel	≤180HB	**VP15TF**	330—500
	Carbon Steel, Alloy Steel	150HB—250HB	**VP15TF**	330—500
M	Stainless Steel	≤200HB	**VP15TF**	230—395

Note 1) The above cutting conditions are general guidelines. Adjustments maybe necessary depending on machine rigidity, work material geometry and clamping.

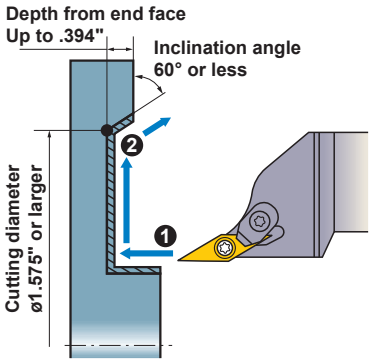
Note 1) Insert photo is an example. Letters show chip breaker style, figures show inscribed circle.

● : **USA Stock**

SXZC type inserts ➤ A192

OPERATIONAL GUIDANCE

Notes when end face profiling



Pay special attention to the following when face profiling.

Machining of an outer diameter (Step ①)

- To prevent burr formation, the depth of cut should be less than half the corner radius.

Machining of an inclination (Step ②)

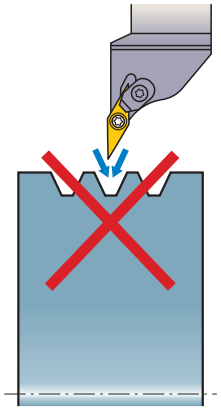
- To reduce the contact length of chips, the depth of cut should be less than half the corner radius.
- To prevent interference between the tool and the work material, the cutting diameter should be 1.575" or larger, inclination angle 60° or less and depth from the end face up to .394".

When changing inserts

- When indexing the inserts, it is recommended to preset the cutting edge position to maintain machining accuracy.

Not possible

Machining of V-pulleys



When machining V-pulleys, use a VNMG insert

HOW TO READ THE STANDARD OF SMALL TOOLS

●How this section page is organized

①Organized according to the cutting mode of small tools.
(Refer to the inside title on the next page.)
②Shown as Turning → External Grooving → External Cutting Off → Threading → Boring.

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict the available machining applications such as external turning, copying, facing, chamfering, threading, and grooving together with cutting edge lead angles.

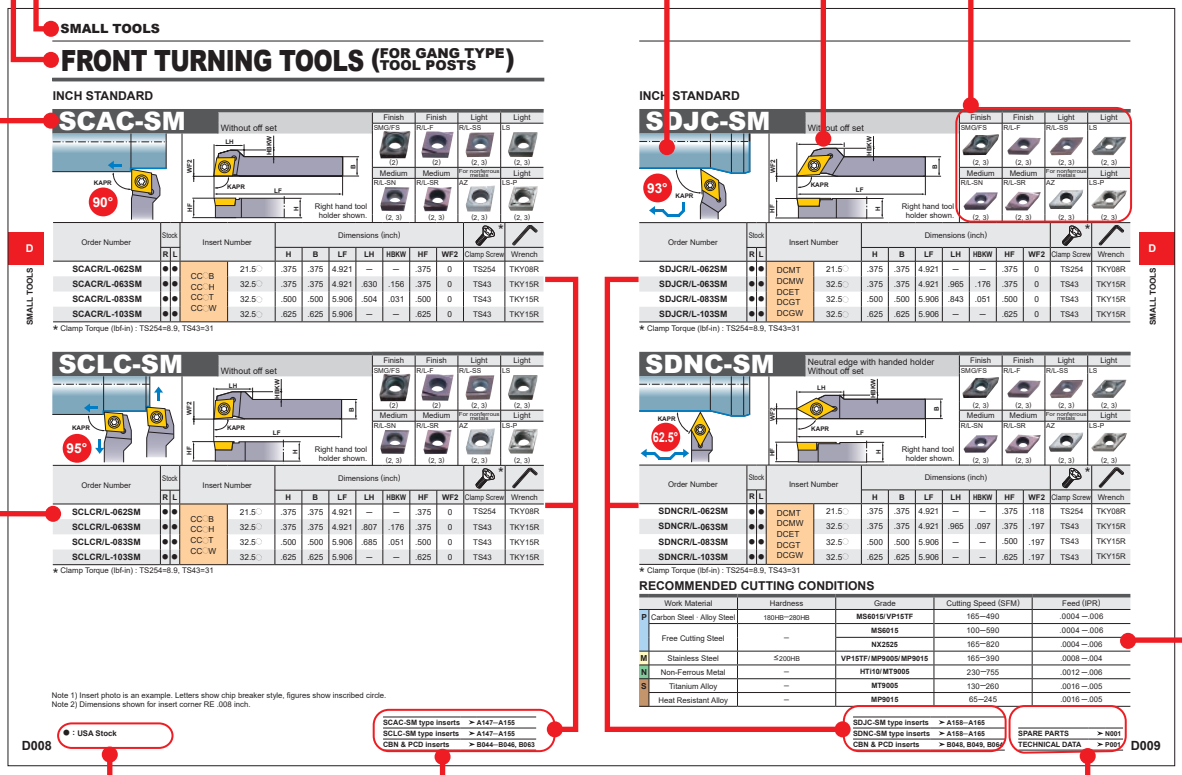
TYPE OF TOOL HOLDER
indicates the first four letters of the order number, as well as cutting applications.

GEOMETRY

CHIP BREAKER BY CUTTING APPLICATION

APPLICATION

PRODUCT SECTION



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

REFERENCE PAGE FOR APPLICABLE INSERTS
indicates reference pages giving details of inserts that are applicable to the product.

PAGE REFERENCE
·SPARE PARTS
·TECHNICAL DATA
indicates reference pages, including the above, on the right hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, dimensions, and spare parts.

RECOMMENDED CUTTING CONDITIONS
for each work material classification, indicates recommended cutting conditions according to the ISO categories for cutting grades, P, M and N.

●To Order : Please specify order number and hand of tool (right/left).

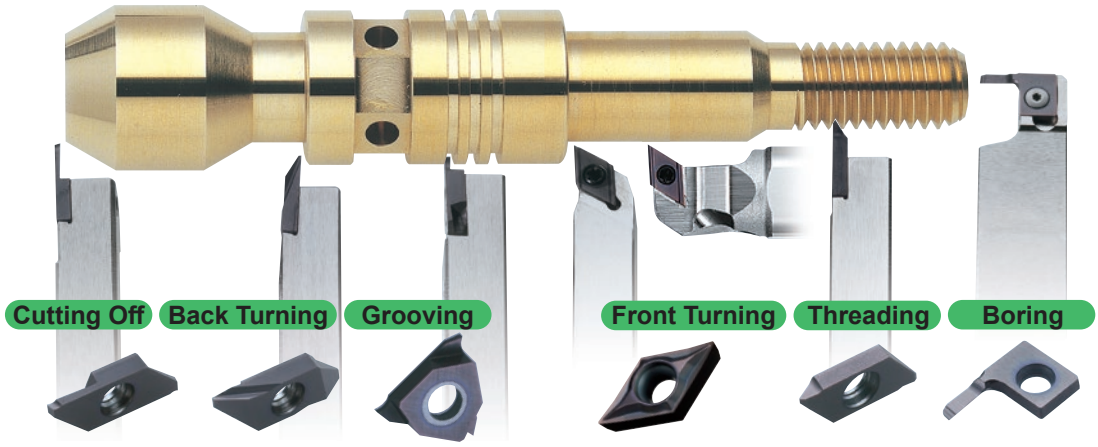
OUTLINE OF SMALL TOOLS

TOOLS FOR GANG TYPE AUTOMATIC LATHES (FOR EXTERNAL TURNING AND BORING)



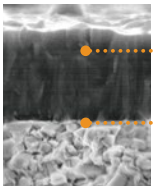
PVD Coated Cemented Carbide Grade for Carbon Steel

MS6015 NEW

Skilled at pure iron, carbon steel and free cutting steel turning and achieving implemented stable finished surfaces and excellent dimensional accuracy.

	MS6015	Conventional
Coating	TiCN multilayer	TiAlN
Hardness (HV)	3,000	2,800
Wear Coefficient (Carbon Steel)	Low	High
Base Material Hardness (HRA)	92.0	92.0
T.R.S (GPa)	2.0	2.0

Ti-C-N Multilayer Coating



Superior wear and welding resistance and demonstrating the best possible results for carbon steel.

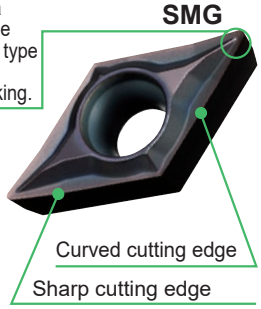
Minute multilayers remarkably improve welding.

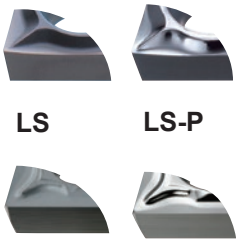
●Molded breaker insert

Nose radii designed with minus tolerance

- Suitable for small parts applications that often require minus tolerance dimensions.
- The order number is shown with the letter "M" that indicates minus tolerance. ex) DCGT32.50.2MFS
- The radius value is printed on the side of the insert label for easy recognition.

A combination of a curved cutting edge and the protrusion type breaker promotes efficient chip breaking.



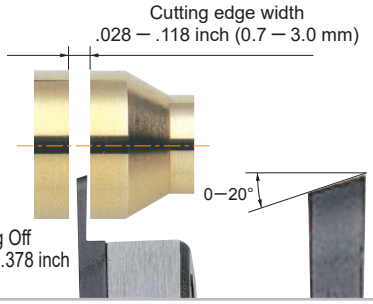


●Tolerance Corner R

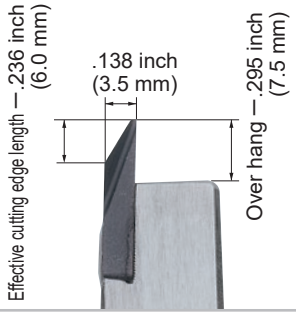
E class
RE $^{0}_{-.0008}$ inch

The letter "M" insert
RE $^{0}_{-.002}$ inch
(Conventional G-class insert
RE ± .004 inch)

●Cutting Off



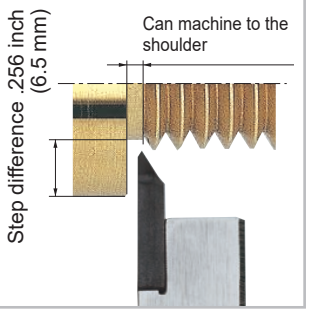
●Back Turning



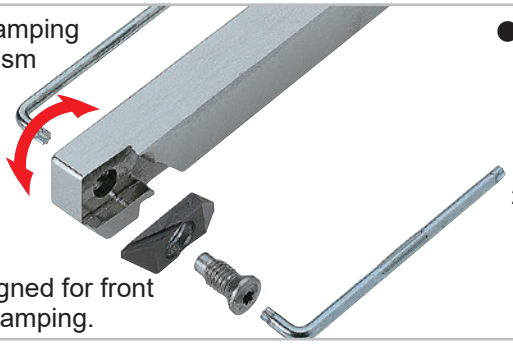
Inserts for Molded Back Turning

SMB Breaker NEW

●Threading



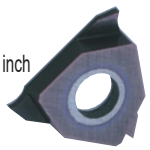
●Back Clamping Mechanism

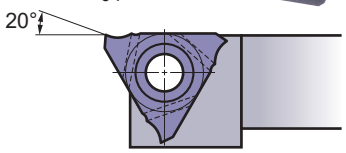


Screw designed for front and back clamping.

●Grooving

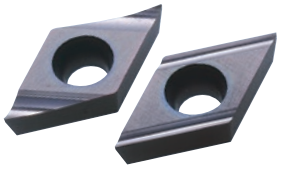
- 3-cornered
- Groove width .012– .118 inch (0.3-3.0 mm)
- Traversing possible





●Front Turning

- ISO E class accuracy inserts
- A wide variety of small corner R inserts
- Rake angle 30°



Tools for a very wide range of small parts machining

External Turning	Tools for front turning, back turning, grooving, threading, and cutting off
Internal Turning	Tools for boring, internal grooving and internal threading
Drilling	Drills
End Milling	End Mills

Tools for front turning, back turning, grooving, threading, and cutting off

Tool Post Type	Gang type, Turret type Radial type
Tool Size	Square holder : .375—.625 inch (8 — 16 mm) Round holder : ≤ ϕ1 inch (ϕ25.4 mm)

Indexable inserts developed under the concept of "high quality, high efficiency and long tool life."

High Quality	E class tolerance, sharp cutting edge, high accuracy small corner R, smooth surface finish
Long Tool Life	PVD coating MS6015/ VP15TF/ MP9005/ MP9015
High Efficiency	Regrinding not necessary due to the employment of indexable inserts. A wide variety of top cutting edge geometries

TOOLS FOR CAM TYPE AUTOMATIC LATHES

- The most suitable for the use with cam type automatic lathes (radial pattern tool posts)
- The most suitable for machining of small parts with work diameter 5mm or smaller
- Single holder for front turning, back turning, grooving, threading and cutting off operations

Front Turning | Back Turning | Grooving | Threading | Cutting Off

INTERNAL TURNING TOOLS

Solid type **MICRO-MINI TWIN Boring Bars**

Minimum cutting diameter ϕ 2.2 mm–

Boring
Grooving
Threading

Round Shank

Square Shank

MICRO-DEX Boring Bars

Minimum cutting diameter
ϕ5.0 mm–

Minimum cutting diameter
ϕ .39 inch–

DIMPLE BAR

DRILLING TOOLS

Solid Carbide Drill
MVS/MVE

Solid Carbide Flat Bottom Drills
MFE NEW

Solid Carbide Drills for Centering and Chamfering
DLE NEW

Micro Solid Carbide Center Drills
MSP

Solid Gun Drill
Micro Solid Carbide Gun Drill with through coolant holes
MGS

END MILLING TOOLS

Solid Carbide End Mill
MSTAR End Mill Series

Vibration Control End Mills for Machining Difficult-to-Cut Materials
SMART MIRACLE End Mill Series

HOW TO READ THE STANDARD OF BORING BARS

●How this section page is organized

①Organized by product series.
(Refer to the index on the next page.)

TYPE OF BORING BAR
indicates the initial letters for the order number, as well as applicable insert types.

TITLE OF PRODUCT SERIES

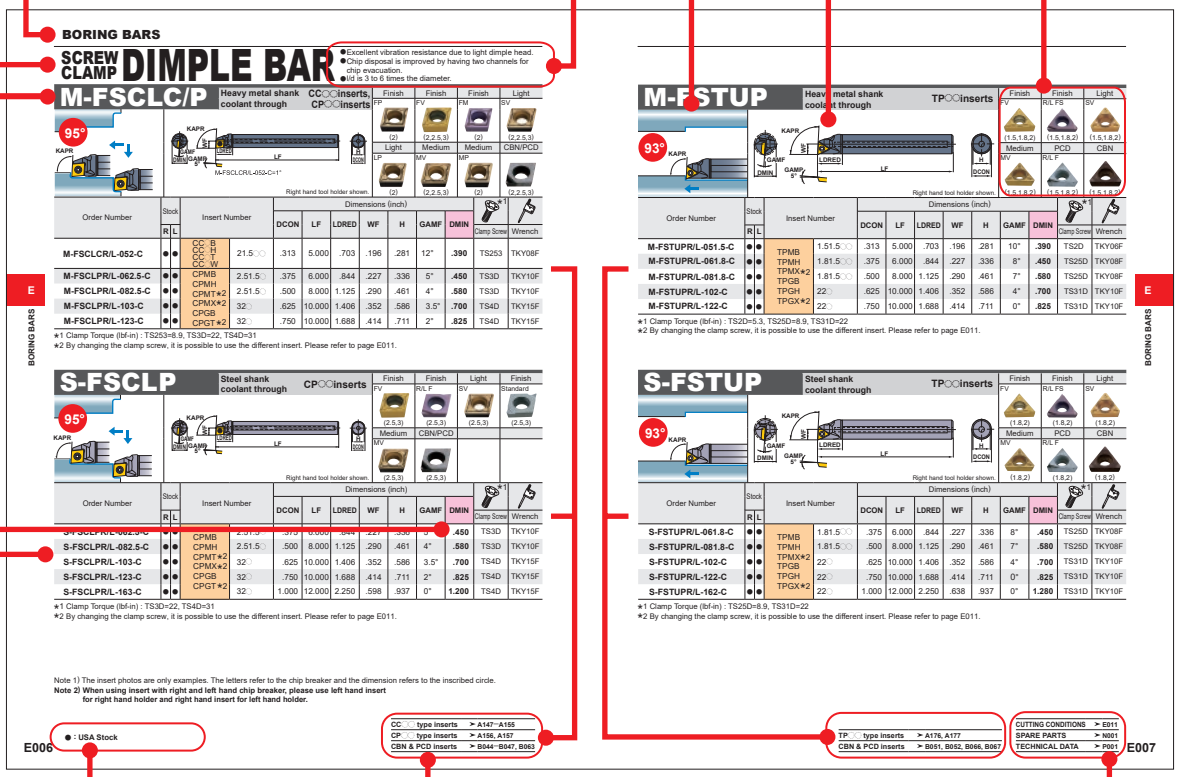
PRODUCT SECTION

PRODUCT FEATURES

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict available machining applications along with cutting edge lead angles.

GEOMETRY

CHIP BREAKER BY CUTTING APPLICATION



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, dimensions, minimum cutting diameters, standard corner radius, recommended l/d ratios, and spare parts.

MIN. CUTTING DIAMETER
is colour-coded to let you find, at a glance, the maximum / minimum cutting diameters for internal machining.

REFERENCE PAGE FOR APPLICABLE INSERTS
indicates reference pages for details of inserts that are applicable to the title product.

PAGE REFERENCE
·SPARE PARTS
·TECHNICAL DATA
indicates reference pages, including the above, on the right hand page of each double-page spread.

●To Order : Please specify order number and hand of tool (right/left).

CLASSIFICATION

Type of Tool	Features	KAPR= 75°	KAPR= 90°, 91°	KAPR= 93°			
		KAPR	KAPR	KAPR			
SCREW CLAMP DIMPLE BAR	● The minimum cutting diameter is ϕ.390 inch. ● 5°, 11° positive insert. ● Excellent vibration resistance due to light dimple head. ● Chip disposal is improved by having two channels for chip evacuation. ● l/d is 3 to 6 times the diameter.			M-FSTUP, S-FSTUP ➲E007	M-FSDUC ➲E008	M-FSVUB/C ➲E009	M-FSWUB/P ➲E009
S Type Boring Bars	● Two wall pocket. ● 7º positive insert, low cutting force. ● Screw-on type.	S-SSKC ➲E015		S-SDUC ➲E014	S-STUC, C-STUC ➲E015, E016	S-SVUC ➲E017	S-SWUC ➲E019
DOUBLE CLAMP DIMPLE BAR	● Negative rake. ● New double clamp type. ● Holds inserts securely. ● Excellent cutting edge repeatability.	S-DSKN ➲E022	S-DTFN ➲E022	S-DDUN ➲E021	S-DVUN ➲E023		
M Type Boring Bars	● Negative rake. ● Two wall pocket. ● Pin lock and top clamp retention. ● (Opt.) Single clamp available as clamp on or pin lock holder.	S-MSKN ➲E025	S-MTFN ➲E025	S-MDUN ➲E024	S-MVUN ➲E026		
AL Type Boring Bars	● Shank sizes ϕ.625 inch thru ϕ1.000 inch. ● Screw-on type. ● Recommended for aluminum, nonferrous metals and plastics.		S-STFE ➲E028				
MICRO-DEX Boring Bars (Carbide Shank)	● The minimum cutting diameter is ϕ5 mm (.197 inch). ● 7°positive insert. ● Carbide shank type. ● Easy-to-use tool geometries. ● Suitable for small workpiece. ● l/d is 5 times the diameter.			SWUB ➲E029	STUC ➲E030		
MICRO-MINI TWIN Boring Bars	● The minimum cutting diameter is ϕ2.2 mm (.087 inch). ● Solid carbide type with two cutting edges. ● Continuous cutting from boring to facing. ● With or without a chip breaker.						
MICRO-MINI Boring Bars	● The minimum cutting diameter is ϕ3.2 mm (.126 inch). ● Solid carbide type (Single cutting edges). ● l/d is 5 times the diameter. ● Cutting edge can be shaped according to the application. Thus, it covers a wide cutting range (threading,grooving,copying, etc.).	C○○F/HR-BLS ➲E031					
Coolant Through Carbide Boring Bars	● Two wall pocket. ● 7° and 11° positive insert, low cutting force. ● Screw-on type. ● Carbide shanks are stocked in various diameters.			E-SDUC ➲E043	E-STUC ➲E044	E-STUP ➲E045	E-SVUC ➲E046
RBH Type Holder	● Holder for MICRO-MINI TWIN and MICRO-MINI. ● Round shanks suitable for use with frontal gang type tool posts with sleeve.	RBH Inch➲E034, Metric➲E036					
SBH Type Holder	● Holder for MICRO-MINI TWIN and MICRO-MINI. ● Square shanks suitable for use with frontal gang type tool posts.	SBH ➲E037					

Note 1) **S** : Steel shank, **M** : Heavy metal shank, **C** : Carbide shank. (For Micro-dex boring bars, carbide shank only.)

DOUBLE CLAMP DIMPLE BAR

- Negative rake.
- New double clamp type.
- Holds inserts securely.
- Excellent cutting edge repeatability.

GRINDING THE CUTTING EDGE OF MICRO-MINI BORING BAR

●MICRO-MINI boring bar can be applied to boring and grooving without any modifications. It can also be reground as shown below.
●For shaping and regrinding, use diamond wet stone approximately #250 - #400. Please grind according to application using the figure below as a reference.

■NOTES

Profile turning, Inner end facing	Copying
The cutting edge should not be cross the center line of the workpiece. 	**The depth of cut should be smaller than the corner radius value.** If the cutting edge crosses the center line of a workpiece, the cutting edge can fracture.	With depths of cut larger than the corner radius value, burrs will be formed.

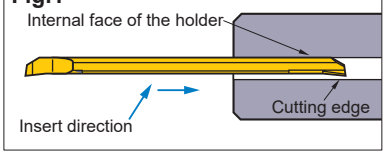
PRECAUTION IN USING THE MICRO-MINI TWIN

■PRECAUTIONS IN USING THE MICRO-MINI TWIN

●When using a holder for general purpose/small automatic lathe

1 To avoid chipping of the 2nd cutting edge take care when inserting the boring bar into the holder. Refer to fig.1 if the 2nd edge contacts the internal face of the holder there is a possibility that it may chip.

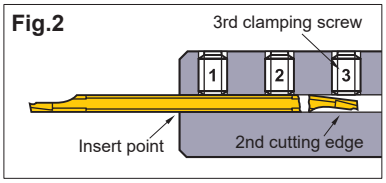
Fig.1



2 When clamping the boring bar into the holder, there is a possibility that damage to the shank and the 2nd cutting edge can occur. Make sure that the clamping screws are tightened to the set torque value. Additionally make sure that there is no clamping screw near the 2nd cutting edge as this can break the boring bar.

◎When using Mitsubishi holders with a tool overhang of 5 lxd, ensure that the 3rd clamping screw is removed prior to machining. (For RBH1620N, RBH19020N there are no 3rd clamping screws). The set torque value for clamping screw is 18 lbf-in. (2.0 N • m)

Fig.2



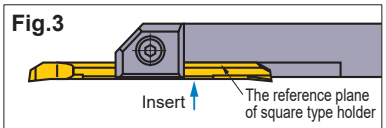
●When using a square type holder

1 When installing the boring bar into the holder, tighten the clamping screw making the micro-mini twin boring bars in contact with the reference plane of square type holder.

2 Make sure that the clamp screw is tightened. The recommended set torque value is shown in the table of holder.

3 Don't tighten the clamp screw without a micro-mini twin boring bar, otherwise the clamp bridge can be deformed.

Fig.3



Tighten the clamping screw ensuring making the micro-mini twin boring bars in contact with the reference plane of square type holder.

COOLANT THROUGH CARBIDE

- Two wall pocket.
- 7° and 11° positive insert, low cutting force.
- Screw-on type.
- Carbide shanks are stocked in various diameters.

HOW TO READ THE STANDARD OF GROOVING AND CUTTING OFF

●How this section page is organized

①Classified according to external or internal applications.
②Sub-classified according to product series.
(Refer to the index on the next page.)

[For External Grooving / Cutting Off]

[For Internal Grooving]

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict available machining applications such as cutting off, grooving, and copying.

INDICATION OF HOLDER TYPE ACCORDING TO APPLICATION
indicates the holder types, such as the standard type or the L type, according to machining application.

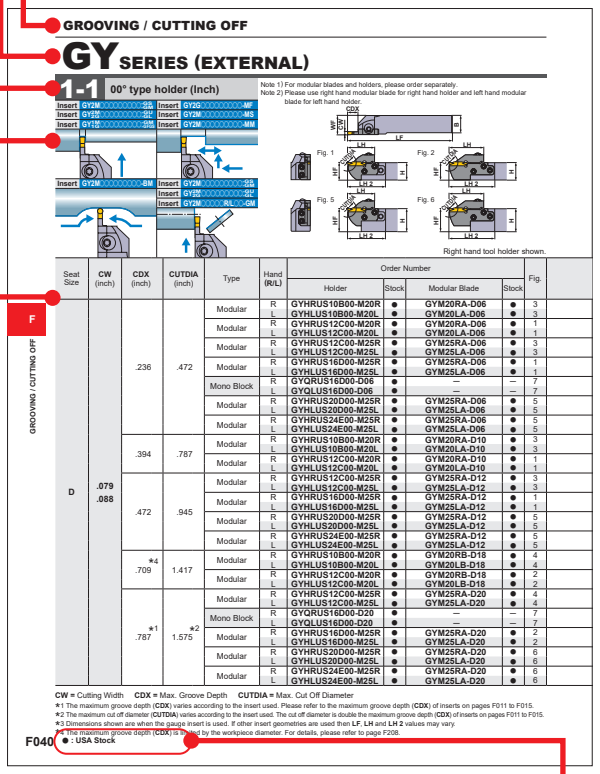
TITLE OF PRODUCT

PRODUCT SECTION

PRODUCT FEATURES

MIN. CUTTING DIAMETER
is colour-coded to let you find, at a glance, the minimum cutting diameters for internal machining.

GEOMETRY



GROOVING / CUTTING OFF

GY SERIES (EXTERNAL)

1-1 00° type holder (Inch)

Note 1) For modular blades and holders, please order separately.
Note 2) Please use right hand modular blade for right hand holder and left hand modular blade for left hand holder.

Right hand tool holder shown.

CW = Cutting Width CDX = Max. Groove Depth CUTDIA = Max. Cut Off Diameter
*1 The maximum groove depth (CDX) varies according to the insert used. Please refer to the maximum groove depth (CDX) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (CUTDIA) varies according to the insert used. The cut off diameter is double the maximum groove depth (CDX) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then LF, LH and LH 2 values may vary.
*4 The maximum groove depth (CDX) is limited by the workpiece diameter. For details, please refer to page F208.

ø70 mm

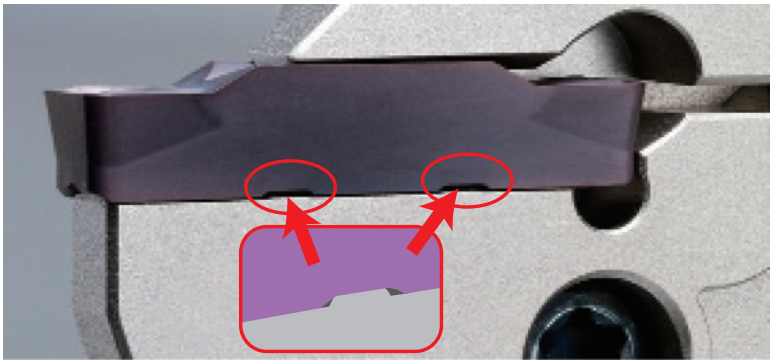
Short shank types are standard stocked

Mono block type: Short | Standard
Modular type: Short | Standard

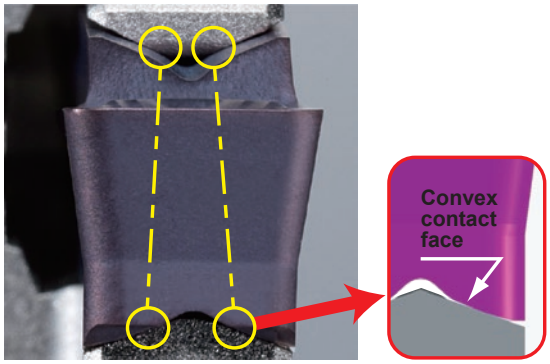
Original insert design leading the way to new grooving and cutting off applications

Highly reliable insert clamping

Safety keys prevent insert movement.



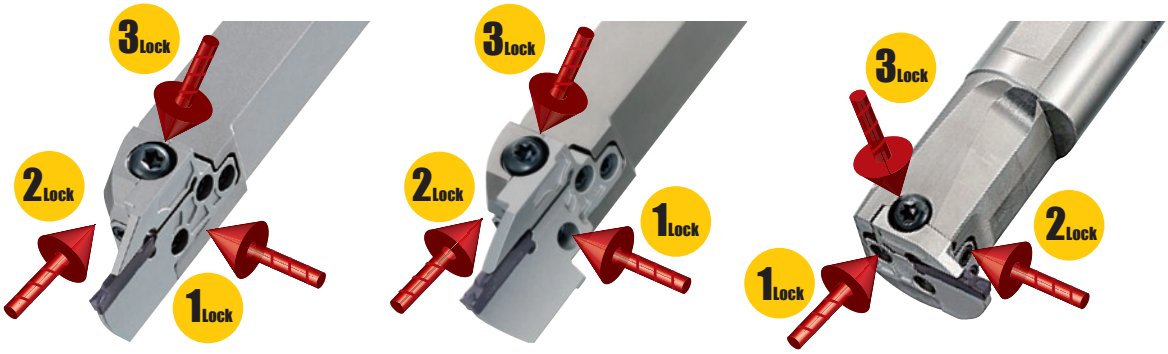
The convex geometry ensures high precision clamping.



New TRI-LOCK System for increased stability and performance!

TRI-LOCK System

The TRI-LOCK system ensures the blade is securely fixed in 3 directions (side, front and top), giving high rigidity for stable grooving and cutting off performance.



A WIDE SELECTION OF INSERTS

● Selection of groove widths

● Different corner radii available

INSERT BREAKER SYSTEM

Grooving

GUBreaker (For Gummy Steel)	GSBreaker (Low feeds)	GMBreaker (Medium feeds)	GFGS (CBN)	GLBreaker (For Aluminum Alloy)

For Multifunctional Grooving / Copying/Recessing

MFBreaker (G class)	MSBreaker (Low feeds)	MMBreaker (Medium feeds)	BMBreaker

Cutting Off

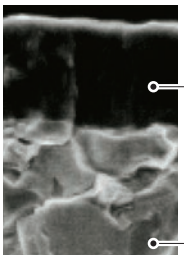
GUBreaker (For Gummy Steel)	GSBreaker (Low feeds)	GMBreaker (Medium feeds)	R/L05-GMBreaker (Medium feeds)	GLBreaker (For Aluminum Alloy)

INSERT GRADE

Work Material / Machining Condition	P Steel	M Stainless Steel	K Cast Iron	N Aluminum Alloy	S Heat resistant Alloy / Titanium Alloy	H Hardened Steel
Stable	NX2525					BC8110
	MY5015		MY5015	RT9010	VP10RT	
Machining Condition	VP10RT	VP10RT			RT9010	MB8025
			VP10RT			
	VP20RT	VP20RT	VP20RT		VP20RT	
Unstable						

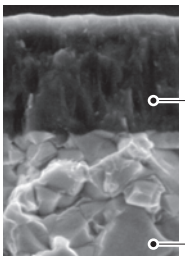
Note1) VP20RT is the first recommended grade for materials other than hardened steels.
Note2) For RT9010, VP10RT, VP20RT and MY5015, wet cutting is recommended.

VP20RT (1st Recommendation)



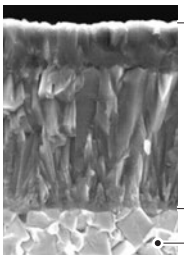
- PVD coated grade suitable for a wide range of applications. The combination of a special tough cemented carbide substrate with MIRACLE coating provides an excellent balance of wear and fracture resistance.

VP10RT (2nd Recommendation)



- PVD coated grade with a cemented carbide substrate harder than VP20RT. For use on difficult to cut materials and for extending tool life.

MY5015



- MY5015 is a CVD coated grade with excellent wear resistance even at high temperatures. It provides longer tool life when machining cast and ductile cast irons. Also suitable for high speed continuous cutting of steels.

RT9010

- First recommended grade for titanium and aluminum alloys.

NX2525

- NX2525, a cermet grade for finish machining of steels and for good surface finishes at lower cutting speeds.

BC8110

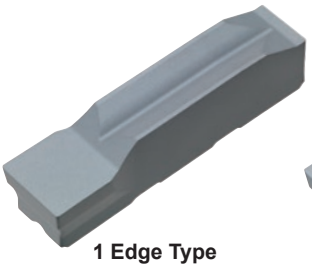
- A CBN coated grade for continuous cutting, which provides longer life when machining hardened steel.

MB8025

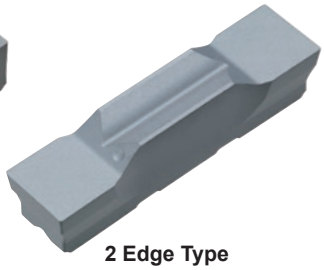
- MB8025 is a sintered CBN grade for hardened steel.

BLANK INSERTS

- Blank inserts for custom grinding



1 Edge Type



2 Edge Type

*1 Insert blank is not suitable for machining without grinding.

RT9010/RT9020 for blank insert

- First recommendation for blanks inserts is RT9020 due to the tougher carbide substrate that is suitable for a wider range of applications.
  RT9010 has a harder substrate than RT9020 and is ideal for longer tool life on stable cutting applications.
  Both grades are recommended to have a coating applied that is suitable for the required application.

035	1.378"	35 mm
040	1.575"	40 mm
⋮	⋮	⋮
250	9.843"	250 mm

*1 Select a seat size with the same symbol as that of the insert.
*2 The maximum groove depth is a value when used for external grooving and changes according to the insert used.
For internal grooving, refer to the maximum groove depth on pages F170—F185.
*3 GYM20R/LA-◯10, GYM20R/LA-◯12, GYM25R/LA-◯12 and GYM25R/LA-◯14 can be used for both external and internal grooving.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2** and **WF** values may vary.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

∗1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
∗2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
∗3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
∗4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2** and **WF** values may vary.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2** and **WF** values may vary.

CW = Cutting Width **DAXN =** Axial groove outside diameter minimum **DAXX =** Axial groove outside diameter maximum **CDX =** Max. Groove Depth

∗1 Dimensions shown are when gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2**, and **WF** values may vary.
∗2 The maximum groove depth varies according to the insert used. Please refer to the maximum groove depth of inserts on pages F011 to F015.

CW = Cutting Width **DAXN =** Axial groove outside diameter minimum **DAXX =** Axial groove outside diameter maximum **CDX =** Max. Groove Depth

⋆1 Dimensions shown are when gauge insert is used. If other insert geometries are used then **LF**, **LH**, **LH 2**, and **WF** values may vary.
⋆2 The maximum groove depth varies according to the insert used. Please refer to the maximum groove depth of inserts on pages F011 to F015.

CW = Cutting Width **CDX =** Max. Groove Depth **DMIN =** Minimum cutting diameter

*1 The maximum groove depth (**CDX**) varies according to the cutting diameter (**DMIN**). For details, please refer to page F222.
*2 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF, LDRED, WF** and **WF2** values may vary.
*3 The maximum groove depth (**CDX**) is a value within the dimension (**LDRED**).

CW = Cutting Width **CDX =** Max. Groove Depth **DMIN =** Minimum cutting diameter

*1 The maximum groove depth (**CDX**) varies according to the cutting diameter (**DMIN**). For details, please refer to page F222.
*2 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF, LDRED, WF** and **WF2** values may vary.
*3 The maximum groove depth (**CDX**) is a value within the dimension (**LDRED**).

CW = Cutting Width **CDX =** Max. Groove Depth **DMIN =** Minimum cutting diameter

*1 The maximum groove depth (**CDX**) varies according to the cutting diameter (**DMIN**). For details, please refer to page F222.
*2 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF, LDRED, WF** and **WF2** values may vary.
*3 The maximum groove depth (**CDX**) is a value within the dimension (**LDRED**).

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

CW = Cutting Width **CDX =** Max. Groove Depth **CUTDIA =** Max. Cut Off Diameter

*1 The maximum groove depth (**CDX**) varies according to the insert used. Please refer to the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*2 The maximum cut off diameter (**CUTDIA**) varies according to the insert used. The cut off diameter is double the maximum groove depth (**CDX**) of inserts on pages F011 to F015.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth (**CDX**) is limited by the workpiece diameter. For details, please refer to page F208.

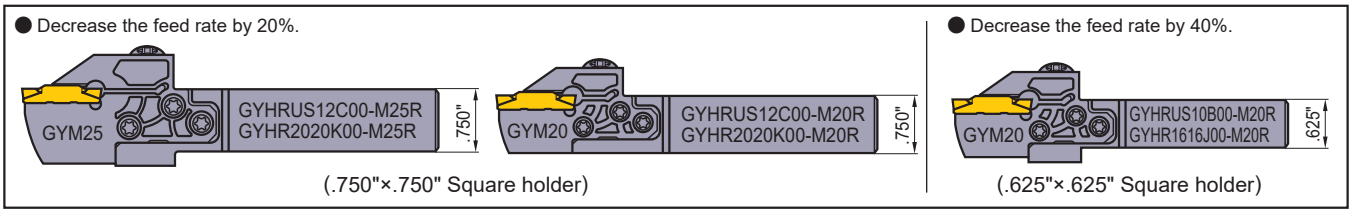
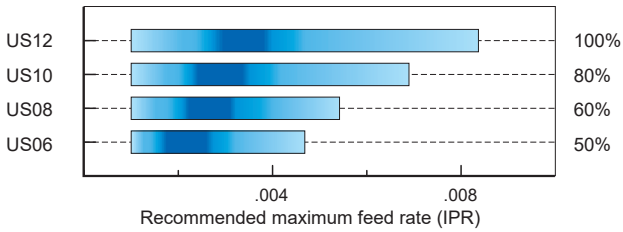
J	.236", 6.00 mm .248", 6.31 mm .250", 6.35 mm
K	.315", 8.00 mm

Note 1) When using a combination as shown below, decrease the recommended feed rate by 20% and 40% respectively.



■ For Swiss style lathes mono block holder

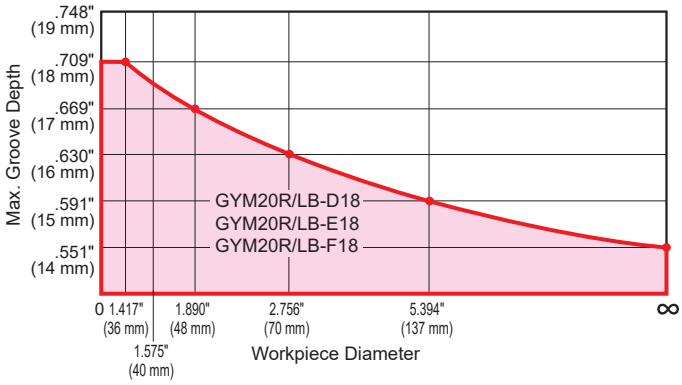


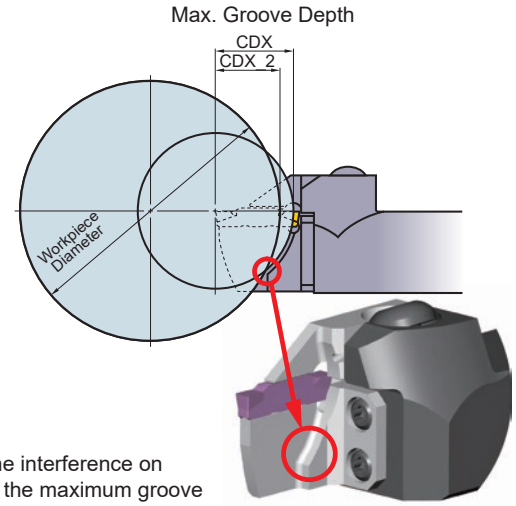
Please refer to the tables of recommended cutting conditions for external grooving.
Apply the percentage ratio shown of each shank size to the values in those tables.

LIMITATION OF THE MAXIMUM GROOVE DEPTH [For External Grooving]

•When using the modular blade GYM○○R/LA-○○○
The maximum groove depth is not limited by the workpiece diameter.

•When using the modular blade GYM○○R/LB-○○○
The maximum groove depth is limited by the workpiece diameter.



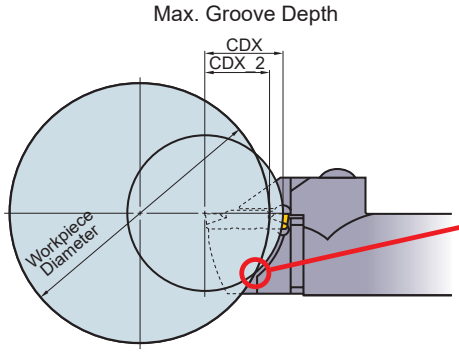


Due to the interference on this part, the maximum groove depth is limited by the workpiece diameter.

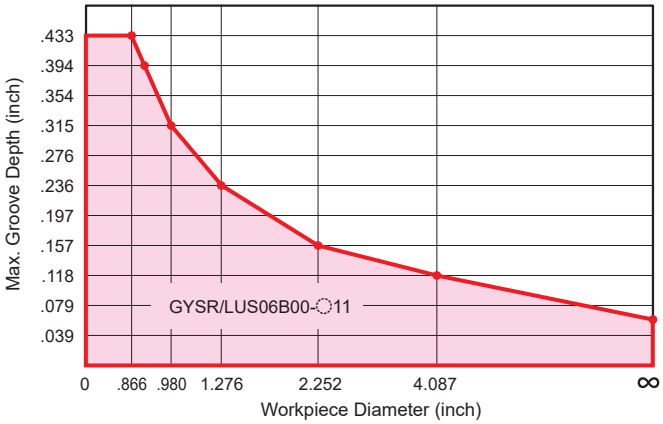
LIMITATION OF THE MAXIMUM GROOVE DEPTH [For External Grooving]

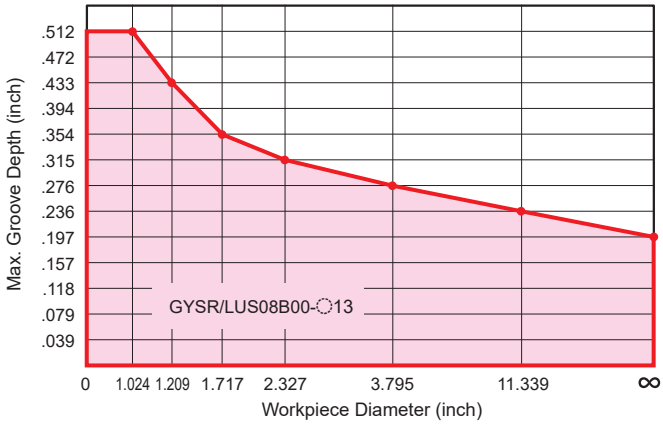
•For Swiss style lathes mono block holder

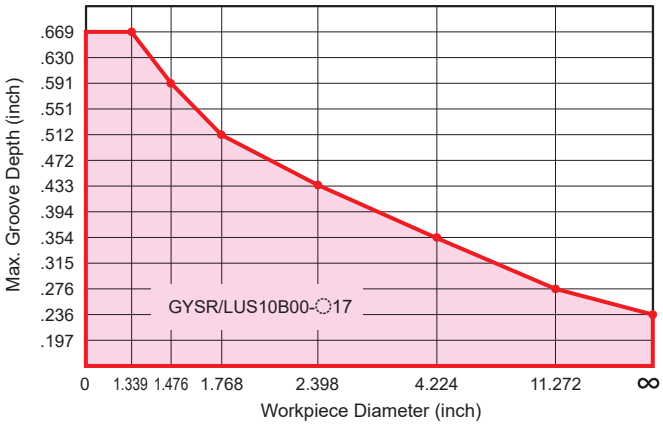
The maximum groove depth is limited by the workpiece diameter.

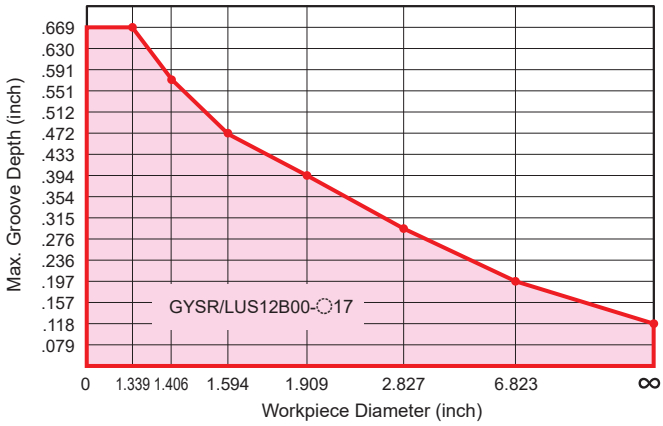


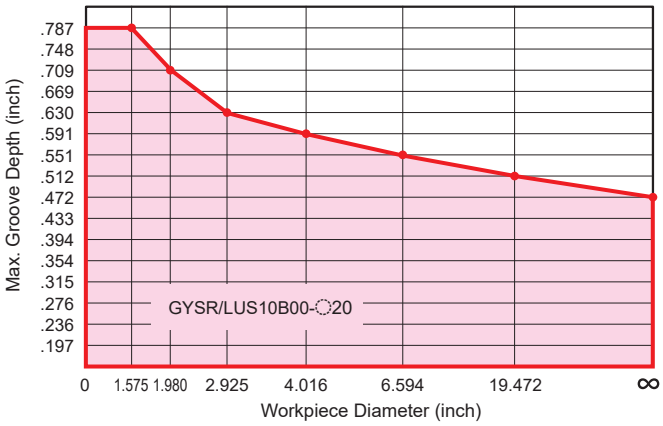
Due to the interference on this part, the maximum groove depth is limited by the workpiece diameter.

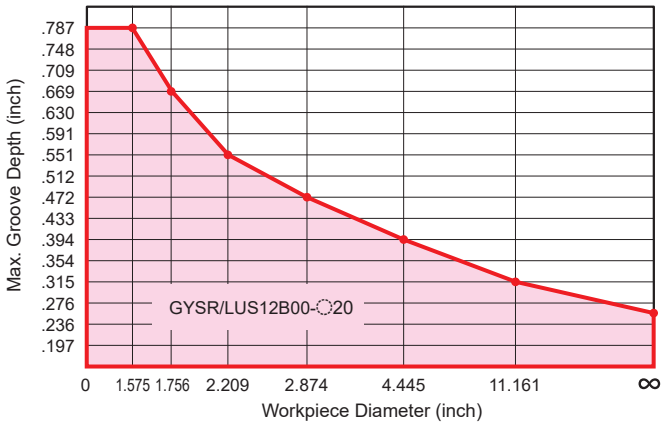












RECOMMENDED CUTTING SPEED (SFM) [For External Recessing]

	Work Material	Hardness	Grade	Cutting Speed (SFM) 165–330–490–655–820
P	Mild Steel	≤180HB	VP20RT	260–590
			VP10RT	295–620
	Carbon Steel, Alloy Steel	180–280HB	VP20RT	195–460
			VP10RT	230–490
			MY5015	295–690
			NX2525	180–440
		280–350HB	VP20RT	165–360
			VP10RT	195–395

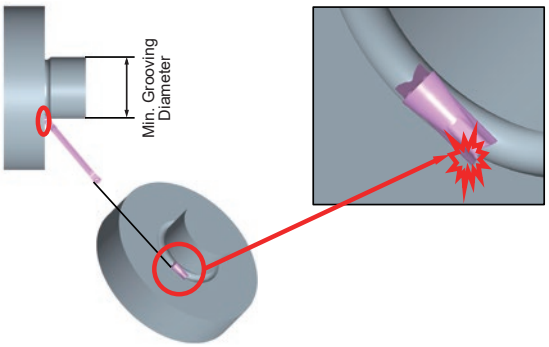
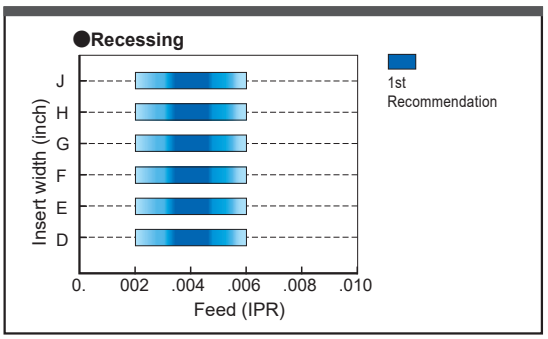
BM BREAKER

Minimum grooving diameter

Ensure the tool is suitable for the diameter being machined. Refer to the Min. Grooving Diameter as shown in the table on the first page to avoid a collision with the workpiece as shown below.



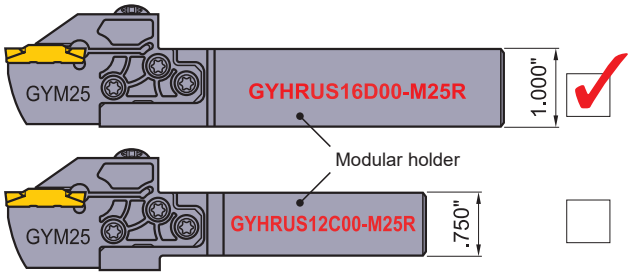
■ Recommended feed rate and depth of cut



TOOL SELECTION

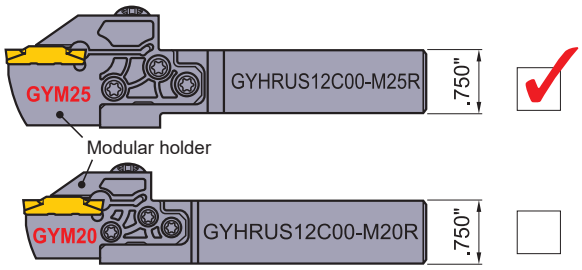
Notes when selecting the tool body

Modular holder



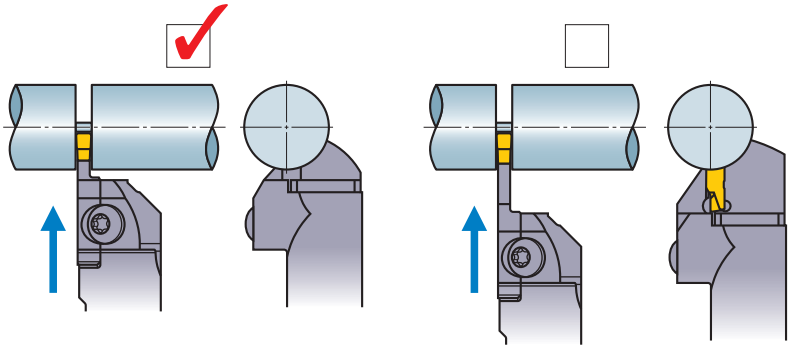
●To ensure sufficient clamping rigidity, select a modular holder with the largest possible shank size.

Modular blade (1)



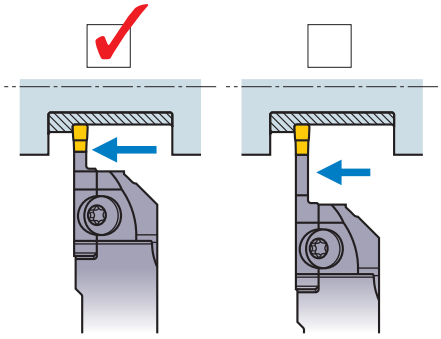
●If there is no restriction for use, select the largest modular blade for the same shank size.

Modular blade (2)



●Select the shortest possible blade suitable for the application.

Modular blade (3)

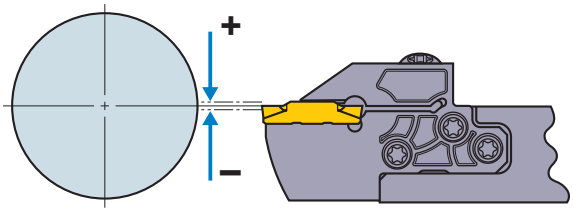


●Select the shortest possible blade suitable for the application.

✓: **Recommended.**

Notes when setting the tool

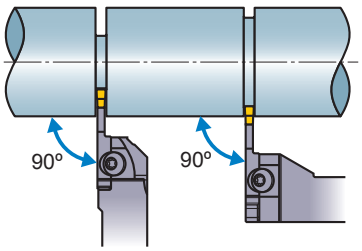
Setting of cutting edge height



<Grooving/Cross-feed machining>
Set the cutting edge height to ±.004" parallel to the central axis.

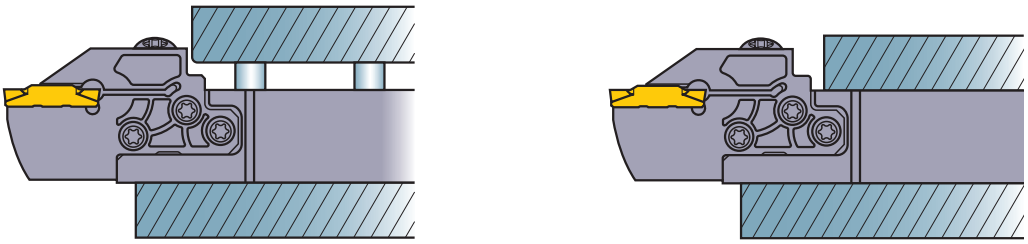
<Cutting off>
Set the cutting edge height to 0–+.008" parallel to the central axis.

Tool body setting angle



●Set the insert perpendicular to the central axis.

Overhang

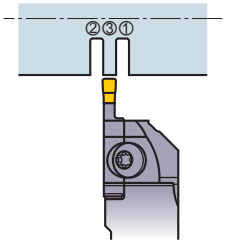


●When setting the tool, ensure that the overhang is as short as possible and avoid the step difference part as above figure shows.

MACHINING RECOMMENDATIONS

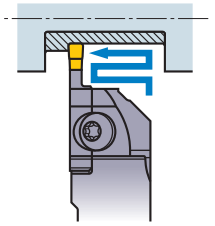
Notes on multi-functional machining (MF·MS and MM breakers)

Machining narrow grooves



●It is recommended to carry out plunging in several passes. Following the steps above makes it difficult for chips to elongate. This also improves the accuracy of workpiece wall surface.

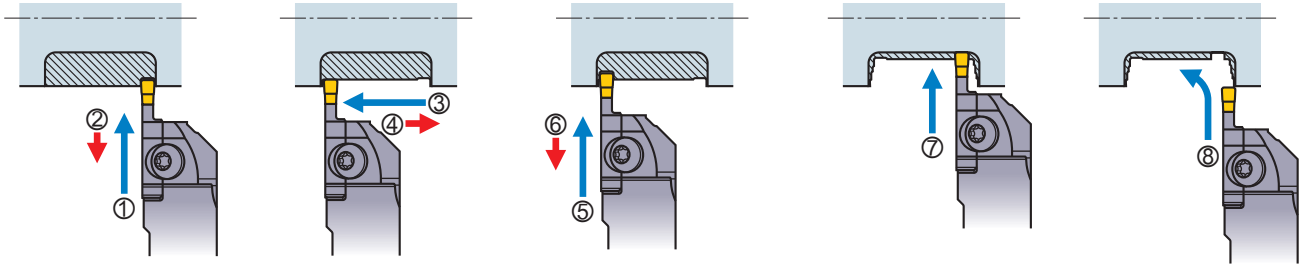
Machining wide grooves



●It is recommended that cross-feed machining is used.

Machining wide grooves

Roughing → **Finishing**



①Carry out grooving.
②Retract the tool approx .004".

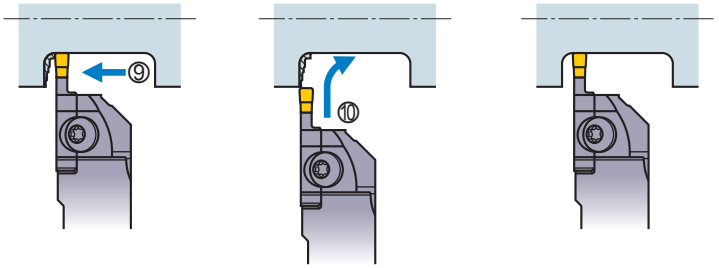
③Carry out cross feed machining.
④Retract the tool approx .004".

⑤Carry out grooving.
⑥Retract the tool approx .004".
* Repeat the steps ①–⑥.

⑦Carry out grooving to the end point of the corner radius.

⑧Machining of the wall surface, corner radius and bottom face should be carried out in one process.

Finishing

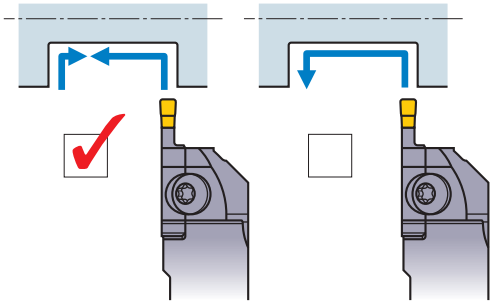


⑨Stop at the bottom of the corner radius.

⑩Machine the counter wall to the corner radius in one process.

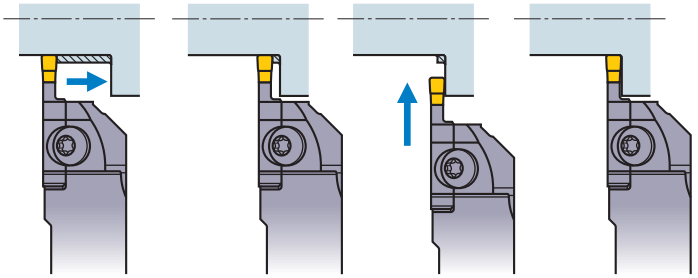
⑪Finish machining.

Precautions when finishing walls



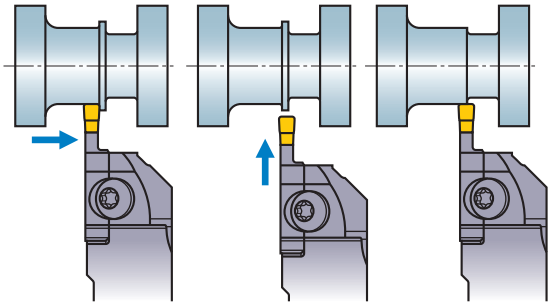
●To produce high accuracy walls using MS or MM breaker insert, do not carry out back turning. Plunging is recommended.

Wall machining



●When machining a wall, chip jamming can occur. In this case, stop cross feed machining just before the wall (at a point less than the insert width) then remove the remaining material by plunging.

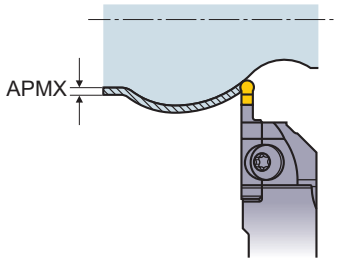
Machining of a ring section



●When a ring remains in a cross feed end process, finish cross feed machining .040"–.059" short of the end point, then remove the ring by plunging.

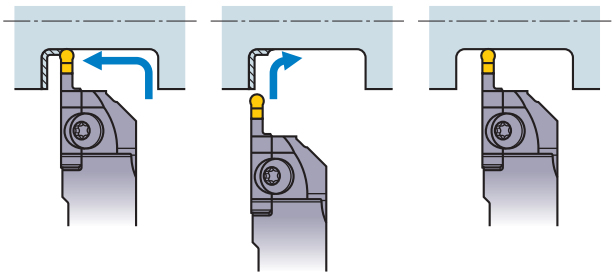
Notes on multi-functional machining (BM breaker)

Copying



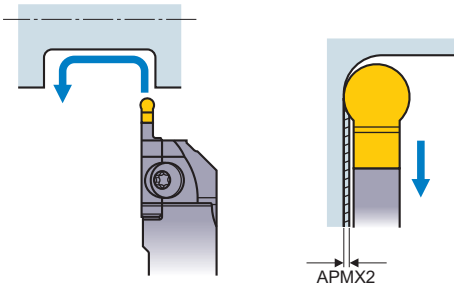
●With the BM breaker insert, 3 dimensional copying is possible.
Set the depth of cut (APMX) to 40% less than the insert width.

Roughing



●Use plunging and cross-feed machining.
When machining the corner, vibration is likely to occur. To avoid this, reduce the feed by 50%.

Finishing



●Carry out finishing in one process.
For the depth of cut (APMX2) when back turning, refer to the table on the right.

Insert	APMX2 (inch)
GY2M0200D100N-BM	.002
GY2M0250E125N-BM	.004
GY2M0300F150N-BM	.006
GY2M0318F159N-BM	
GY2M0400G200N-BM	.008
GY2M0475H238N-BM	.009

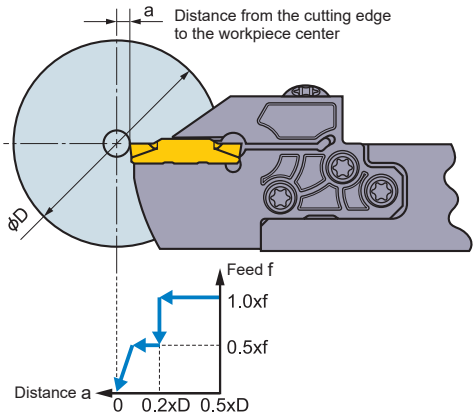
GY2M0600J150N-BM	.012
GY2M0635J318N-BM	
GY2M0800K400N-BM	.016

MACHINING RECOMMENDATIONS

Notes for cutting off

feed

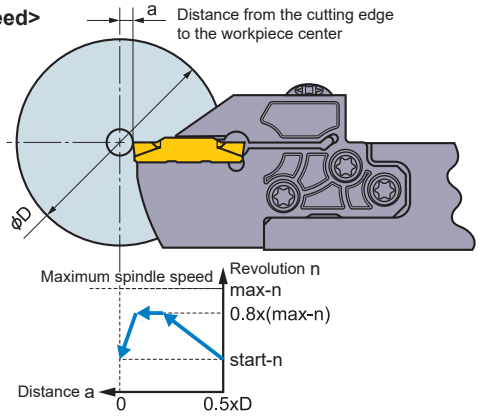
<Feed>



- When the cutting edge approaches the center, reduce the feed by 50%.
- If necessary, stop the feed prior to reaching the center of the workpiece. The part will fall off because of its own weight.

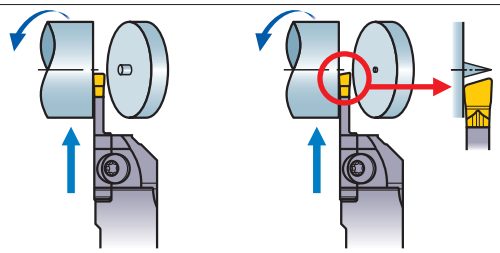
Revolution

<Spindle speed>

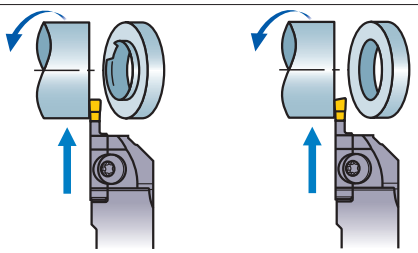


- When using constant cutting speed during a cutting off cycle, it is recommended to limit the spindle speed to 80% of maximum to ensure stability.
- To prevent the workpiece from being expelled, lower the spindle speed before finishing the grooving operation.

insert



Neutral insert　　Handed insert

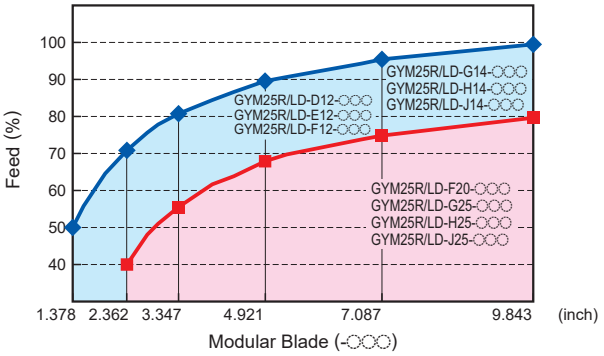


Neutral insert　　Handed insert

- When there is a center stub on solid bar work or burrs are formed on pipe material, it is possible to decrease them by using a handed insert. With a handed insert, machining tends to be less stable when compared to using a neutral insert. Pay special attention to avoid fracturing of the cutting edge and decrease the feed when necessary.

Memo

RELATIONSHIP BETWEEN THE MODULAR BLADE AND FEED PER ROTATION [For Face Grooving]



Note 1) Adjust the feed per rotation in the cutting conditions to the percentage shown in the table above.

RECOMMENDED CUTTING SPEED (SFM) [For Face Grooving]

	Work Material	Hardness	Grade	Cutting Speed (SFM) (165 – 985)
P	Mild Steel	≤160HB	VP20RT	260 – 590
			VP10RT	295 – 620
			NX2525	230 – 560
	Carbon Steel Alloy Steel	160—280HB	VP20RT	195 – 460
			VP10RT	230 – 490
			MY5015	295 – 690
			NX2525	180 – 440
		280HB≤	VP20RT	165 – 360
			VP10RT	195 – 395
			MY5015	260 – 525

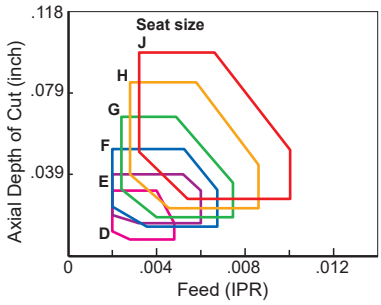
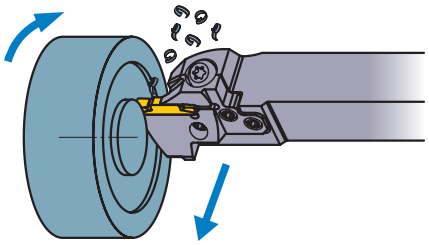
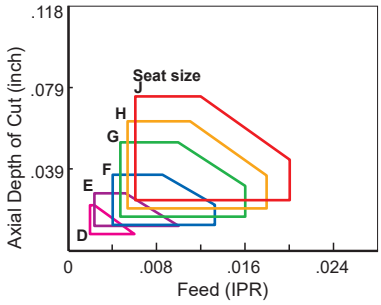
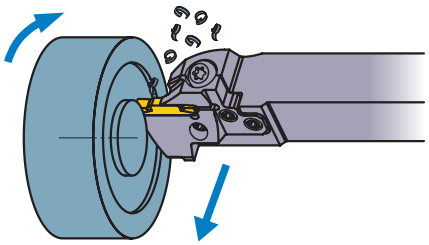
TRAVERSE MACHINING (MM/MS BREAKER)





TRAVERSE MACHINING (BM BREAKER)

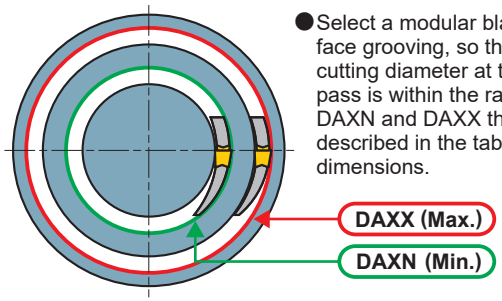




TOOL SELECTION

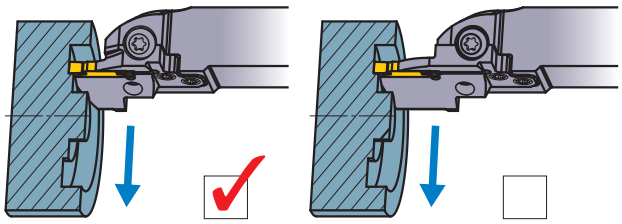
Notes when selecting the tool body

Modular blade (1)



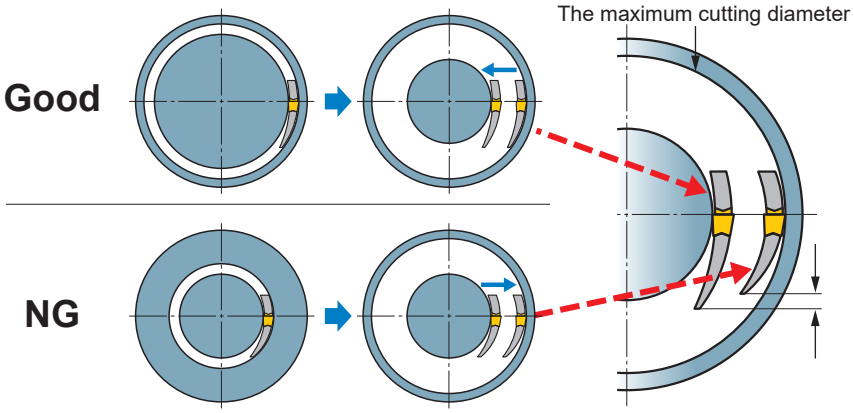
- Select a modular blade for face grooving, so that the cutting diameter at the first pass is within the range of DAXN and DAXX that are described in the table of dimensions.

Modular blade (2)



- Select the shortest possible blade suitable for the application.

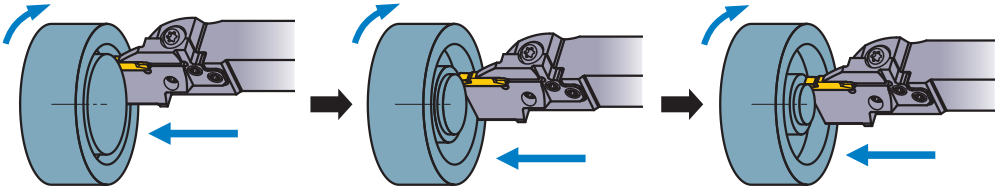
Modular blade (3)



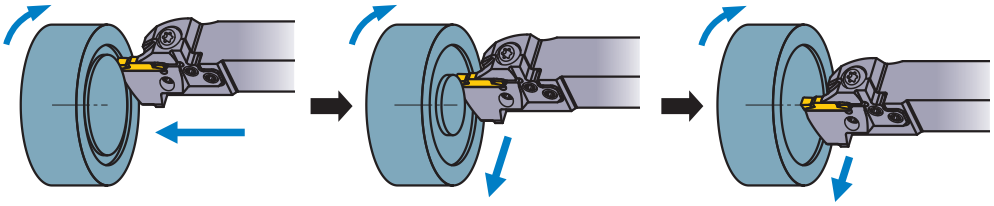
- Select the largest size blade within the maximum cutting diameter of the workpiece.
- Machine from the outer diameter towards the center.
- Increased machining stability and rigidity is possible if a modular blade with the largest possible back metal is used.

- At first, machine the maximum cutting diameter, there is no restriction in the cutting diameter on the remaining process.

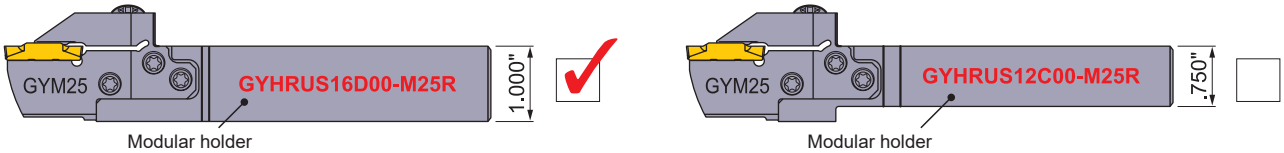
- When plunging in several passes.



- When combining plunging and infeed machining.



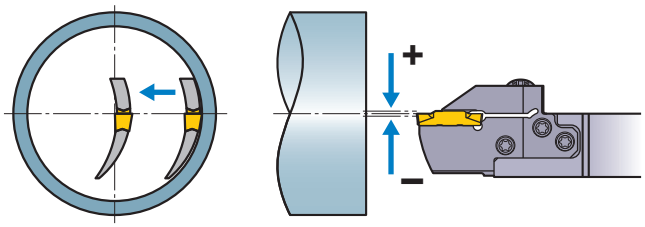
Modular holder



- To ensure sufficient clamping rigidity, select a modular holder with the largest possible shank size.

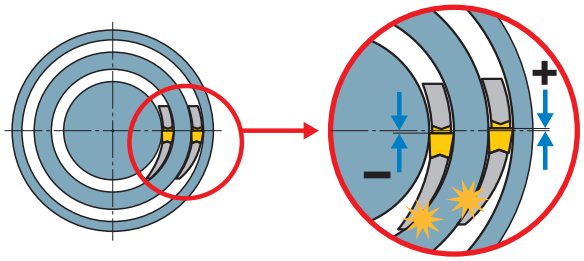
Notes when setting the tool

Setting the cutting edge height



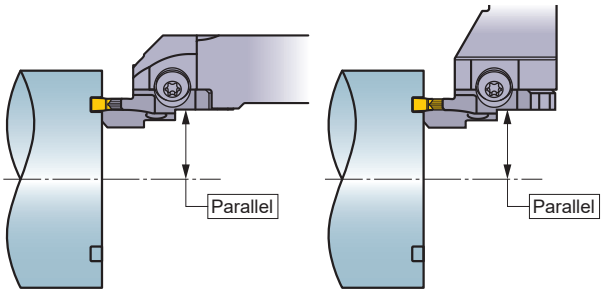
●Set the cutting edge height to ±.004" parallel to the central axis.
●Cutting edge center height check should be done by traverse machining towards the center with a very small depth of cut and ensure that an even surface and no material remains at the center point afterwards.

When interfering the wall of groove and the Modular blade



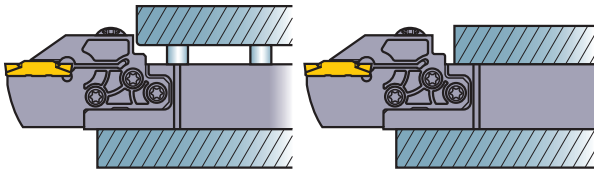
●If interference occurs even when the correct blade is used, the cutting edge height could be incorrect.
- When interference occurs on the inner side of the blade, the cutting edge height is set too high.
- When interference occurs on the outer side of the blade, the cutting edge height is set too low.

Setting the tool



●Set the insert parallel to the central axis.

Tool overhang



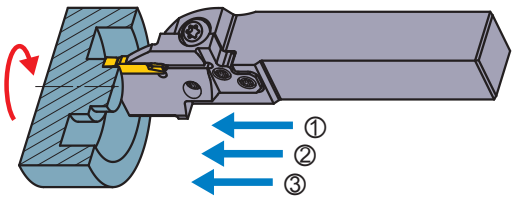
●When setting the tool, ensure that the overhang is as short as possible and avoid the step difference part as above figure shows.

MACHINING RECOMMENDATIONS

Notes when face grooving

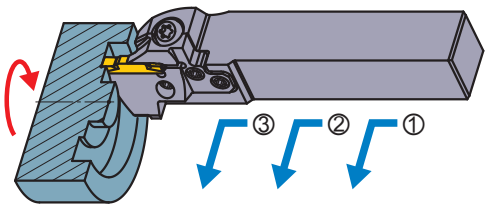
●Always machine from the outer diameter towards the center.

Machining narrow grooves



●Plunging in several passes is recommended.

Machining wide grooves

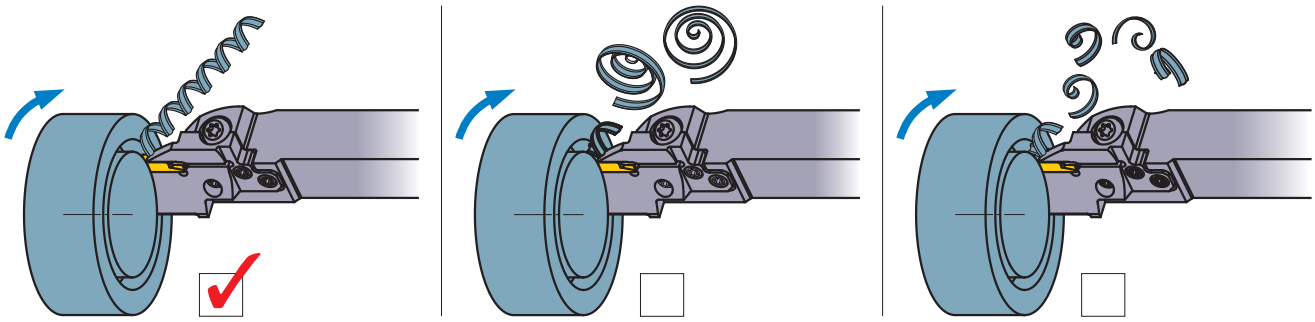


●Cross feed machining is recommended.

MACHINING RECOMMENDATIONS

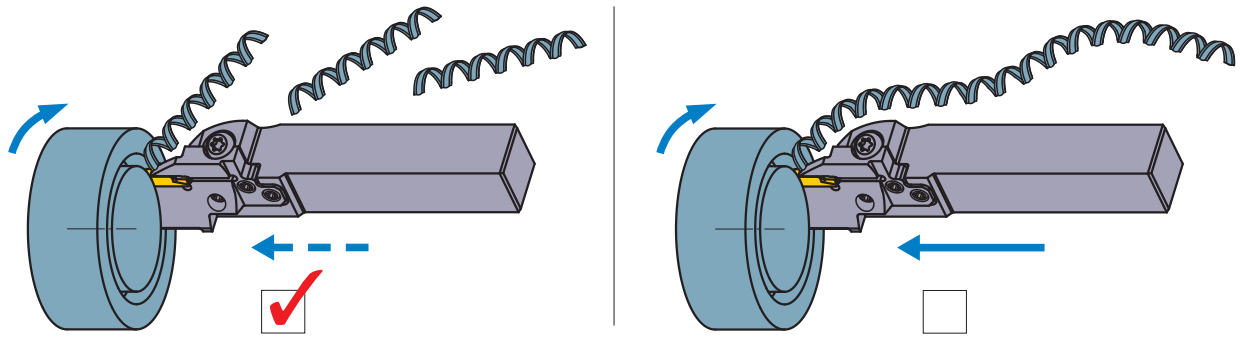
Notes when face grooving

Notes on the first pass (1)



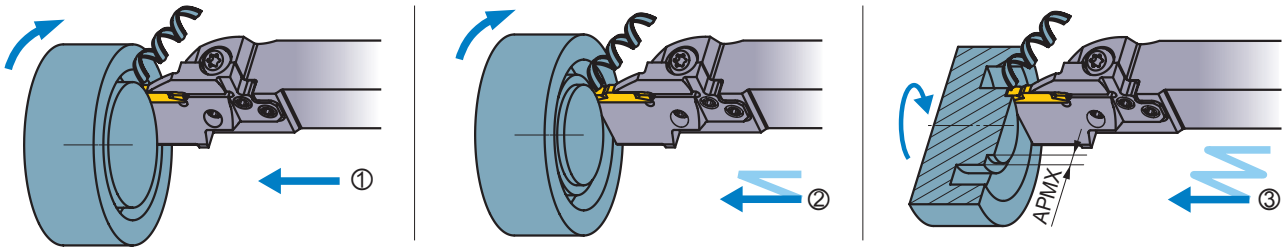
●During the first face grooving pass it is difficult to disperse broken chips and can lead to problems such as a chipped insert. Maintain longer chips that disperse easily by decreasing the feed per rotation.

Notes on the first pass (2)



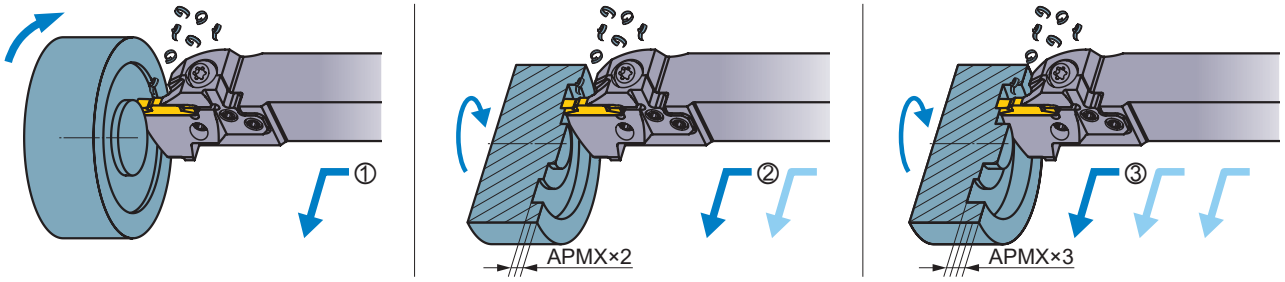
●When chips become too long, use peck feed to break them into a suitable length.

Notes when wide face grooving by plunging in several passes.



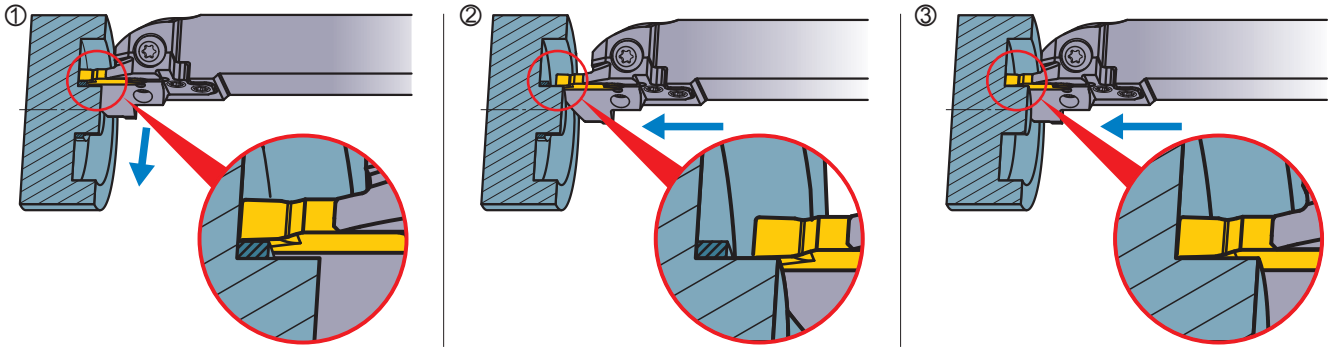
●When machining a face groove in several passes, machine from the outer diameter towards the center so that space for discharging chips is created to prevent insert damage caused by chip jamming.
●Plunging width of cut is recommended to be set at 60 - 80% of the insert width. This enhances the effect of the chipbreaker by enlarging the width of the groove to improve chip dispersal.

Notes when wide face grooving by combination of plunging and traverse machining (1)



●When face groove machining by using plunge feed and traverse machining, always machine from the outer diameter towards the center to disperse chips outward to avoid chip jamming problems.
●Set the depth of cut within 40% of the insert width.

Notes when wide face grooving by combination of plunging and traverse machining (2)

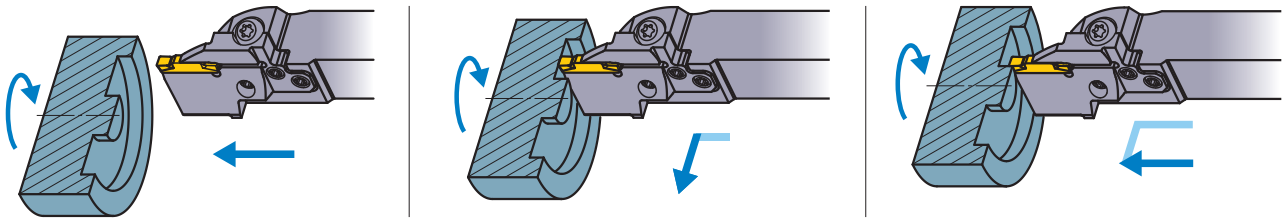


●When infeed machining at the bottom of deep groove, chips may interfere on the cutting edge near the center wall.
In such cases, stop infeed machining just before the center wall (at a point less than the insert width) then remove the remaining material by plunging.

Notes when copying (BM Breaker)

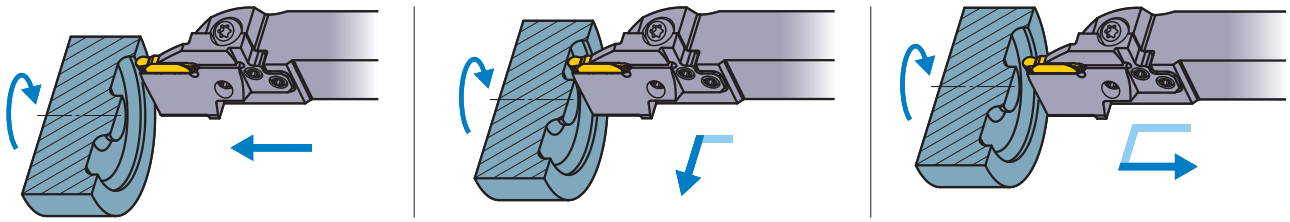
●With the BM breaker insert, 3 dimensional copying is possible. Set the depth of cut (APMX2) to 30% of the insert width.

Finishing (1)

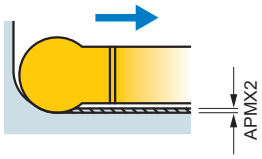


●When finish cutting, machine continuously from the outer wall to the bottom of the groove, then finally plunge cut the center wall.

Finishing (2) (BM Breaker)



●Carry out finishing in one process.
For the depth of cut (APMX2) when back turning, refer to the table on the right.



Insert	APMX2 (inch)

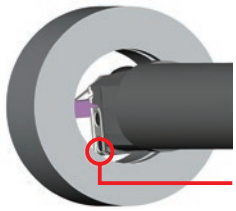
LIMITATION OF THE MAXIMUM GROOVE DEPTH [For Internal Grooving]

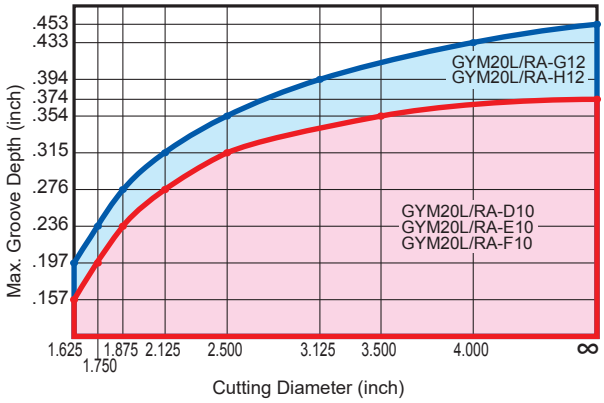
•When using the mono block type
The maximum groove depth is not limited by the cutting diameter.

•When using the modular blade type
The maximum groove depth is limited by the cutting diameter.

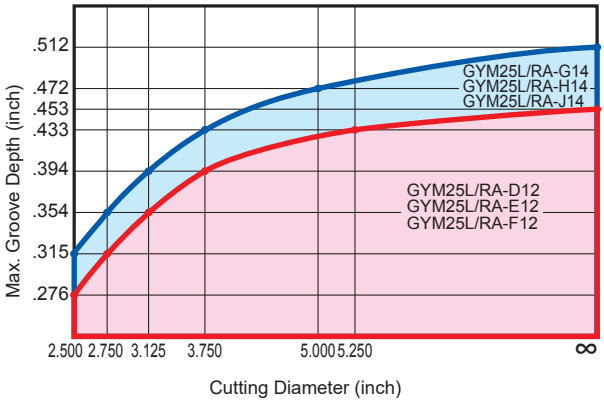


Due to interference of this part, the maximum groove depth is limited by the cutting diameter.

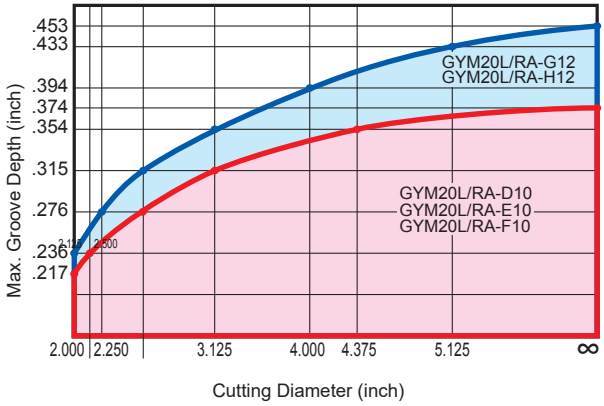
Shank Diameter=1.250 inch (GYM20 Blade)



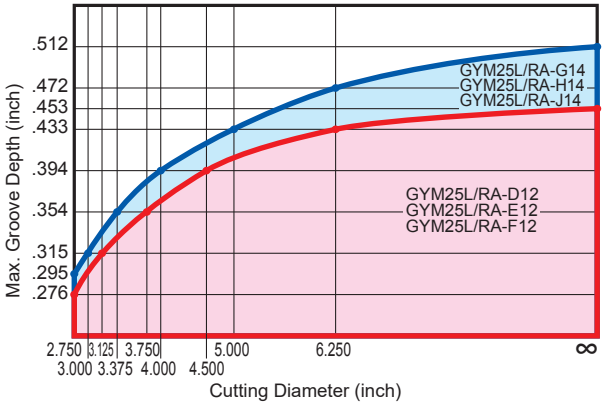
Shank Diameter=1.500 inch (GYM25 Blade)



Shank Diameter=1.500 inch (GYM20 Blade)



Shank Diameter=2.000 inch (GYM25 Blade)

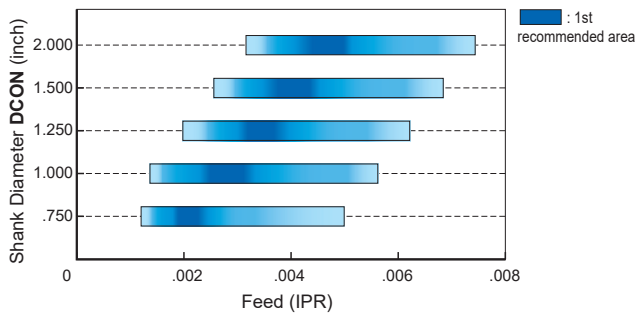


RECOMMENDED CUTTING SPEED (SFM) [For Internal Grooving]

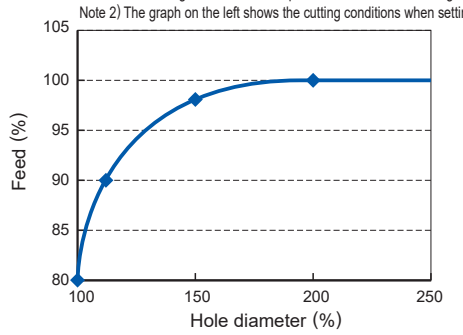
	Work Material	Hardness	Grade	Cutting Speed (SFM) 165–1310
P	Mild Steel	≤160HB	VP20RT	260–590
			VP10RT	295–620
			NX2525	230–560
	Carbon Steel Alloy Steel	160–280HB	VP20RT	195–460
			VP10RT	230–490
			MY5015	295–690
			NX2525	180–440
		280HB≤	VP20RT	165–360
			VP10RT	195–395
			MY5015	260–525
			NX2525	150–345
M	Stainless Steel	≤270HB	VP20RT	165–360
			VP10RT	195–395
K	Gray Cast Iron	Tensile Strength ≤300MPa	VP20RT	195–460
			VP10RT	230–490
			MY5015	295–690
	Ductile Cast Iron	Tensile Strength ≤800MPa	VP20RT	165–360
			VP10RT	195–395
			MY5015	260–525
S	Heat Resistant Alloy Titanium Alloy	–	VP20RT	100–195
			VP10RT	130–230
			RT9010	130–230
H	Hardened steel	50HRC≤	BC8110	195–330
			MB8025	195–330
N	Aluminum Alloy	Content Si<5%	RT9010	490–1310
	Aluminum Alloy	Content 5%≤Si≤10%	RT9010	490–1310
	Aluminum Alloy	Content Si>10%	RT9010	260–525

Note 1) VP20RT is the first recommended grade for materials other than hardened steels.
Note 2) For RT9010, VP10RT, VP20RT and MY5015, wet cutting is recommended.

GROOVING

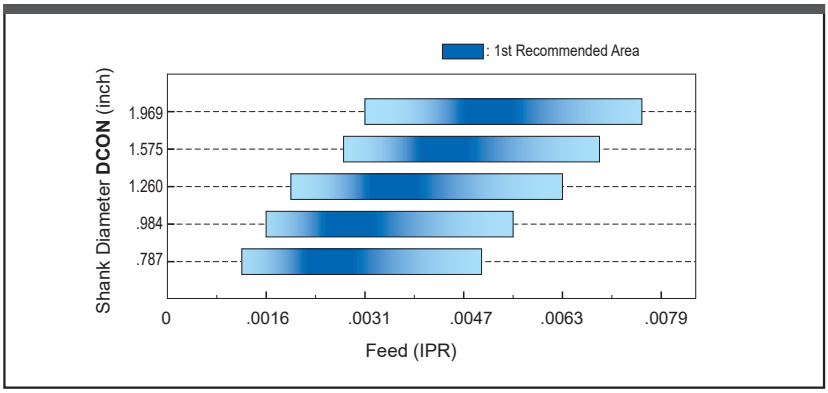


Note 1) The cutting diameter 100% represents the minimum cutting diameter (DMIN).
Note 2) The graph on the left shows the cutting conditions when setting the feed to 100%.

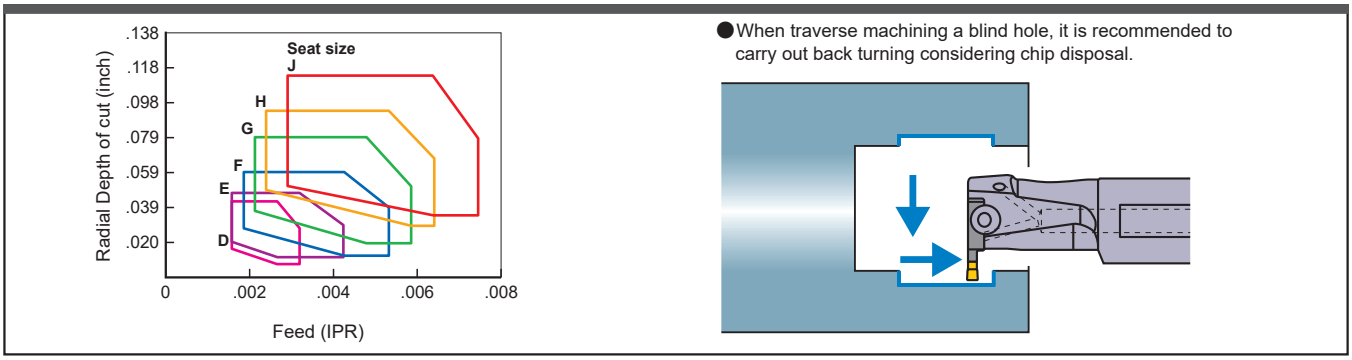


RECOMMENDED CUTTING CONDITIONS [For Internal Grooving]

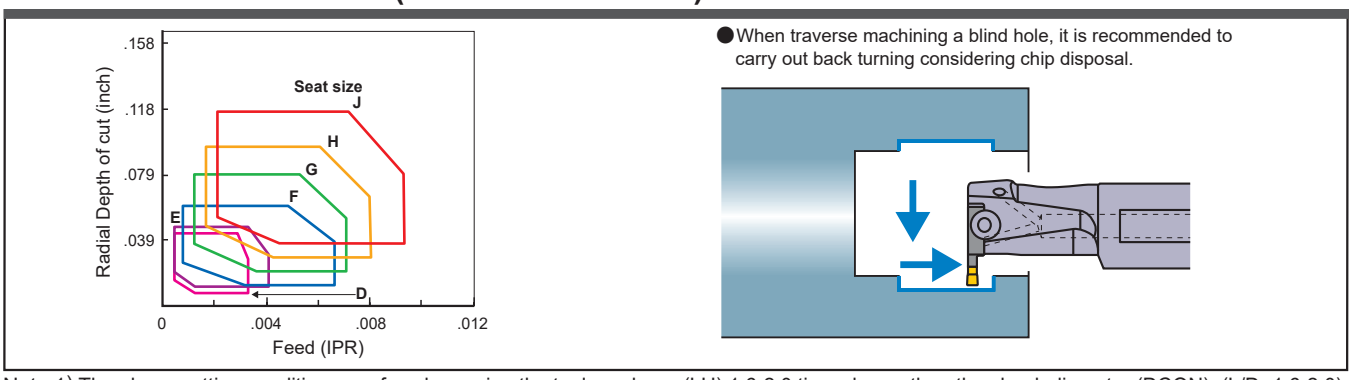
GROOVING (GL BREAKER)



TRAVERSE MACHINING (MF BREAKER)

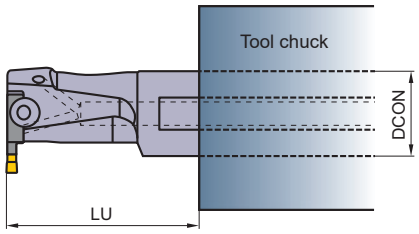


TRAVERSE MACHINING (MM/MS BREAKER)



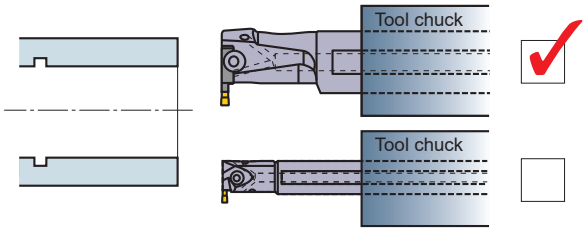
Note 1) The above cutting conditions are for when using the tool overhang (LU) 1.6-2.0 times larger than the shank diameter (DCON). (L/D=1.6-2.0)
When using L/D larger than 2.0, reduce the cutting conditions.

	Seat Size / Insert Width
D	.079", 2.00 mm .088", 2.24 mm
E	.094", 2.39 mm .098", 2.50 mm .108", 2.74 mm
F	.118", 3.00 mm .125", 3.18 mm .128", 3.24 mm
G	.157", 4.00 mm .167", 4.24 mm
H	.187", 4.75 mm .197", 5.00 mm .206", 5.24 mm
J	.236", 6.00 mm .248", 6.31 mm .250", 6.35 mm



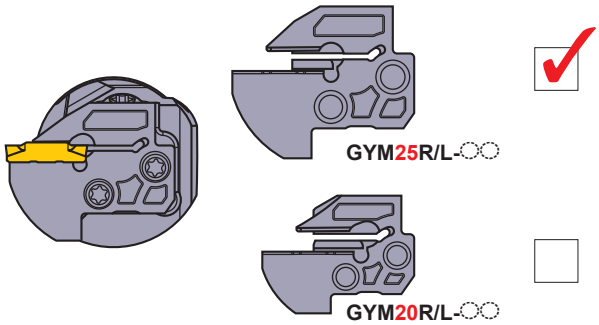
Notes when selecting the tool body

Holder



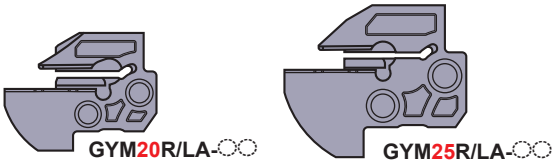
●When the overhang is the same, select a holder with the largest possible shank size to ensure sufficient clamping rigidity.

Modular blade (1)



●For a ø1.5" & ø40 mm shank holder, if there is no restriction for use, select a holder suitable for GYM25 blade.

Modular blade (2)

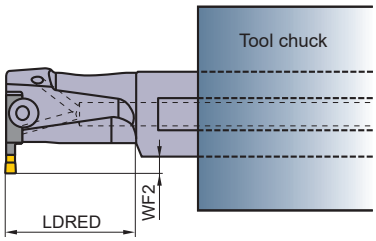


GYM20R/LA-D10	GYM25R/LA-D12
GYM20R/LA-E10	GYM25R/LA-E12
GYM20R/LA-F10	GYM25R/LA-F12
GYM20R/LA-G12	GYM25R/LA-G14
GYM20R/LA-H12	GYM25R/LA-H14
	GYM25R/LA-J14

●For an internal holder, select a modular blade listed above.

Notes when setting the tool

Over hang



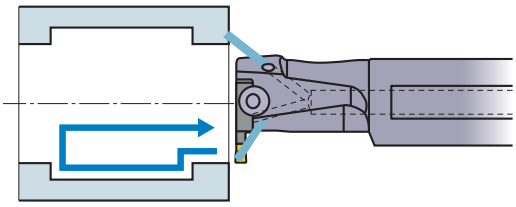
●The maximum groove depth is limited to the dimension LDRED. When machining with longer overhangs, refer to the dimension WF2 of the tool used.

MACHINING RECOMMENDATIONS

Notes on multi-function machining (MF, MS and MM breakers)

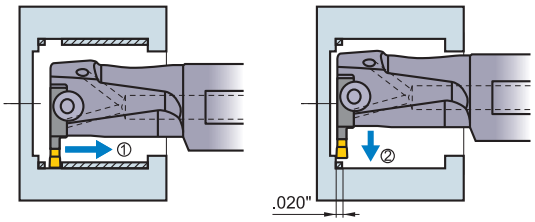
For internal grooving, the machining methods for external grooving (F212 – F213) can be used, but please note the following precautions.

Coolant



●Supply large amounts of coolant for effective chip disposal during cutting. Maintain supply until the tool has been retracted completely for improved chip disposal.

Machining blind holes

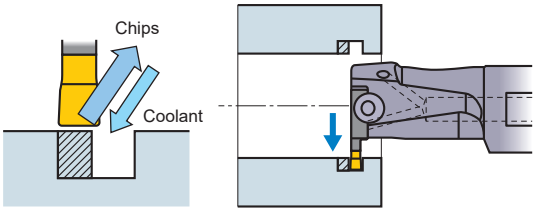


●As continuous chips tend to elongate at the back of the bore, the above operation is recommended.
The recommended width of cut for ② is .020 inch.

Machining Wide Grooves

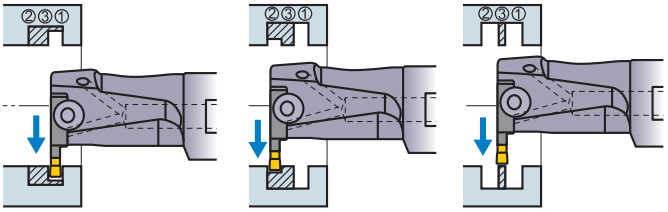
Grooving

●When the insert width is x 2 ≥ groove width



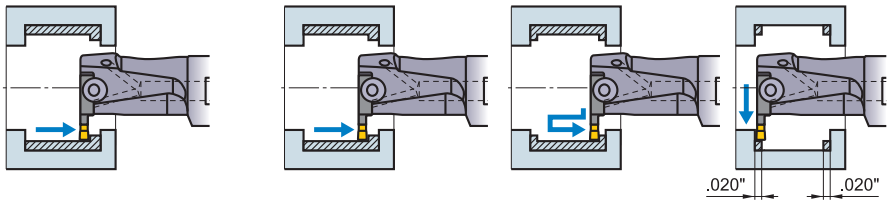
●When the depth of cut is shallower than the insert width, continuous chips are usually produced. When plunging in several passes, it is recommended to carry out machining in the steps above. This ensures that coolant reaches the cutting edge and chips are easily discharged.

●When the insert width is x 2 < groove width



●When the groove depth is larger than the insert width, carry out plunging in the steps above to break up chips efficiently.

Turning

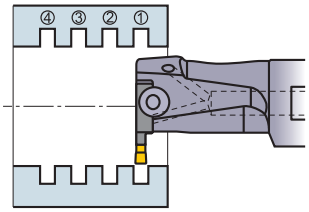


●When chip breaking and disposal are especially important, cross-feed machining is recommended.

●Wide face grooving when the corner R of the workpiece is equal to the corner R of the insert, machine as shown above. (When corner R of the workpiece is larger than corner R of the insert, refer to the description of external wide grooving.)

●If the groove depth exceeds a given level, chips may elongate at the wall. In such a case, increase the feed and carry out machining as shown above.

Machining instruction



●It is recommended to carry out grooving from the front end of the workpiece. This reduces workpiece deflection.

Memo

GW Series

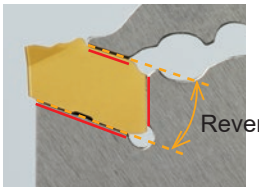
NEW

Easy to Utilize Configuration that Improves Tool Handling

Clamp

Simple insert clamping method offering high rigidity.

To prevent the insert from being pulled out during machining a reverse taper angle has been designed from the front of the insert. Additionally the design also includes 3 large locating faces between the insert and the blade offering increased cutting edge reliability. The blade itself is made from a special alloy steel to suit this application.
In respect to insert indexing, a unique wrench is supplied to ensure ease when changing the insert.



Voice of Developer

Just how easy is it to set an insert?

With the use of a unique wrench, it is possible to locate and remove the insert with one simple action making it easier for use in the workplace.

Through Coolant Blade

Increased wear resistance due to the use of 2 through coolant ejection holes.

2 through coolant holes supply the coolant to both the rake and flank face, leading to effective cutting edge cooling and increased wear resistance. Additionally this blade can also be used for both low pressure and high pressure coolant (1000 PSI).

Voice of Developer

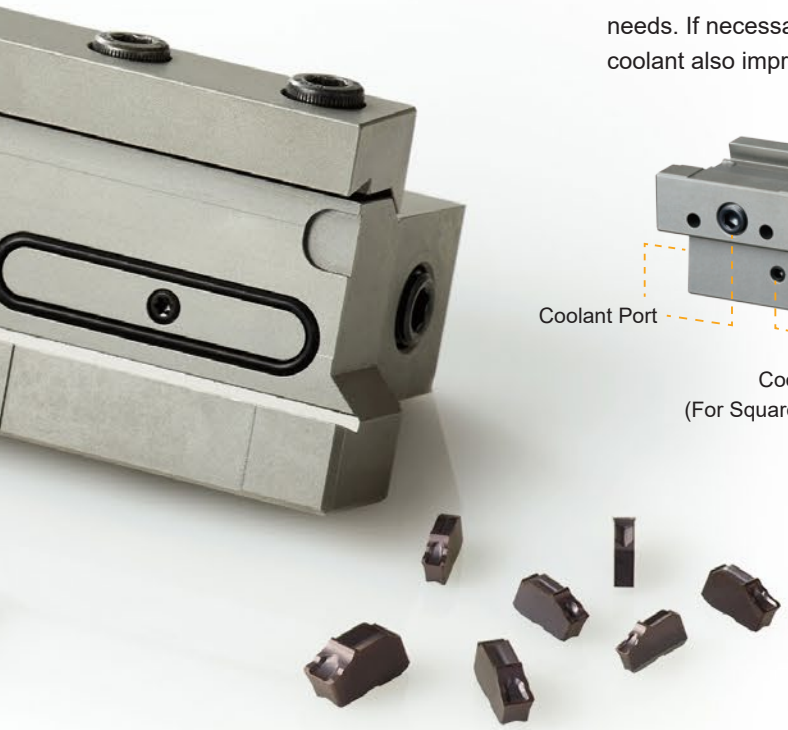
How is it possible to reduce heat generation?

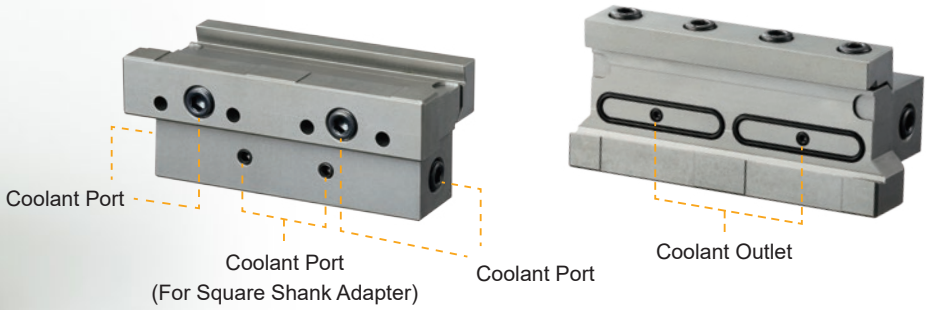
The 2 coolant holes used in the blade are capable of using high coolant pressures of up (1000 PSI). This is achieved by using as large as possible through coolant hole diameter. The ejection holes are located close to the cutting edge to improve the cutting edge cooling effect and increasing wear resistance.

Coolant Ports

Flexible set up possible with the use of 6 coolant ports.

There are 6 coolant ports designed into the tool block. This makes it easier for the end user to set up the tool block and blade to a configuration that suits their needs. If necessary it is also possible to use coolant hose. The ejection type coolant also improves cutting edge cooling and chip evacuation.





Voice of Developer

Possible set up to suit the requirements of the workplace environment.

One of the objectives of this product is to respond to the customers complaints that “the product did not fit and could not be used”. Starting with the coolant outlet that prevents leaks even when oil quantity or overhangs change. Everything from the material and the shape of the O-ring, to the length of the hose has been tailored to the effective use in the workplace.

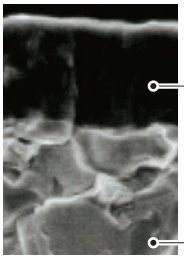
Unstable				

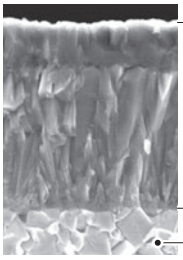
VP20RT (1st Recommendation)



● PVD coated grade suitable for a wide range of applications. The combination of a special tough cemented carbide substrate with MIRACLE coating provides an excellent balance of wear and fracture resistance.

MIRACLE Coating
Carbide Substrate (90.5HRA)

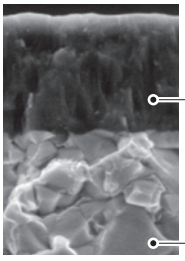
MY5015



● MY5015 is a CVD coated grade with excellent wear resistance even at high temperatures. It provides longer tool life when machining cast and ductile cast irons. Also suitable for high speed continuous cutting of steels.

CVD Coated Carbide
Carbide Substrate

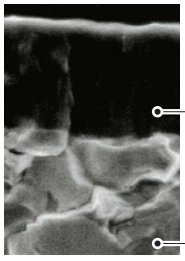
VP10RT



● PVD coated grade with a cemented carbide substrate harder than VP20RT. For use on difficult-to-cut materials and for extending tool life.

MIRACLE Coating
Carbide Substrate (92.0HRA)

VP30RT



● A combination of a tough, special cemented carbide substrate and MIRACLE coating. Ideal for heavy interrupted cutting of stainless and general steels.

MIRACLE Coating (Al,Ti)N
Carbide Substrate (88.8HRA)

HOW TO READ THE STANDARD OF THREADING

●How this section page is organized

①Classified according to external or internal applications.
②Sub-classified according to product series.
(Refer to the index on the next page.)

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict the available machining applications, such as external and internal threading.

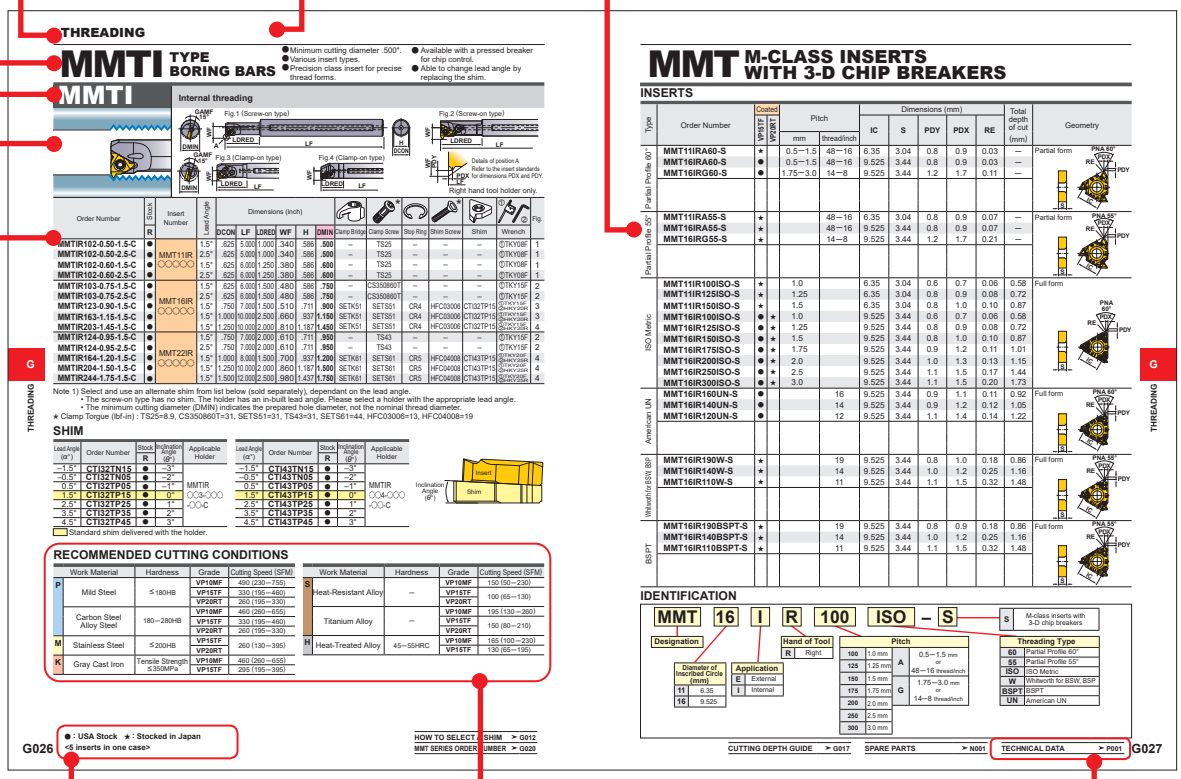
TYPE OF TOOL HOLDER
indicates the initial letters for the order number and cutting applications.

TITLE OF PRODUCT

PRODUCT SECTION

INDICATION OF EXTERNAL /INTERNAL APPLICATION

STANDARDS FOR APPLICABLE INSERTS
indicates stock status, dimensions, etc. for applicable inserts.



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

PAGE REFERENCE ·SPARE PARTS
indicates reference pages, including the above, on the right hand page of each double-page spread.

PRODUCT STANDARDS
indicates order numbers, stock status (per right/left hand), applicable inserts, holder dimensions, and spare parts.

RECOMMENDED CUTTING CONDITIONS
for each work material classification, indicates recommended cutting conditions according to the ISO categories for cutting grades, P, M, K, S, and H.

●To Order : For holder, please specify order number and hand of tool (right/left).
For insert, please specify insert number and grade.

CLASSIFICATION (EXTERNAL THREADING)

Name of Tool Holder	Insert Shape	Features
MMTE Holder G021		● Various insert types. ● Precision class insert for precise thread forms. ● Available with a pressed breaker for chip control. ● Able to change lead angle by replacing the shim.

CLASSIFICATION (INTERNAL THREADING)

Name of Tool Holder	Insert Shape	Features
MMTI **Boring Bars** G026		● Minimum cutting diameter .500 inch. ● Various insert types. ● Precision class insert for precise thread forms. ● Available with a pressed breaker for chip control. ● Able to change lead angle by replacing the shim.
FSL5 **S-SL5** **Boring Bars** G031 G032		● Screw-on type. ● Precision class insert. ● Holder is capable of performing both grooving and threading. ● Maximum groove depth .118 inch.
MICRO-MINI TWIN **Boring Bars** G034	–	● Solid carbide type. ● Economical due to single holder with two cutting edges.
MICRO-MINI **Boring Bars** E031	–	● Solid carbide type. ● Insert can be ground to suit the application.

API Round Casing & Tubing		CSG LCSG	American ACME		ACME (Tw)
API Buttress Casing		BCSG			

PIPE THREADS AND TOOL SELECTION

●Parallel Pipe Threads G(PF)

Thread Type	Number of threads	Standard internal diameter
G1/16	28	.258"
G1/8		.337"
G1/4	19	.451"
G3/8		.589"
G1/2	14	.734"
G5/8		.811"
G3/4		.949"
G7/8		1.098"
G1	11	1.193"
G1·1/8		1.376"
G1·1/4		1.534"

Note 1) Same as PF.

●Taper Pipe Threads R(PT), Rc(PS)

Thread Type	Number of threads	Standard internal diameter
R1/16	28	.258"
R1/8		.337"
R1/4	19	.451"
R3/8		.589"
R1/2	14	.734"
–	–	–
R3/4	14	.949"
–	–	–
R1	11	1.193"
–	–	–
R1·1/4	11	1.534"

Note 1) Same as Rc and PT.

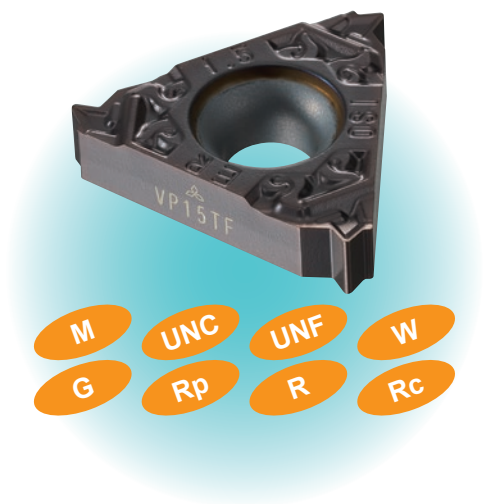
・The pitch is pre-determined for each nominal diameter. Note the minimum machining diameter especially when internal threading.

FEATURES OF MMT SERIES

■A WIDE VARIETY OF CHOICES

Mitsubishi Miracle Threading (MMT) series contains 297 inserts and 23 holders.

M-CLASS INSERTS WITH 3-D CHIP BREAKERS



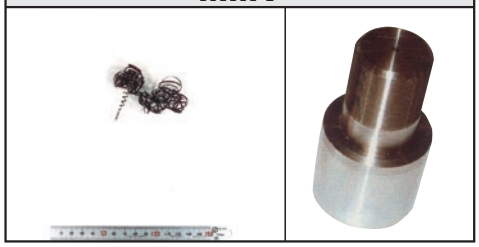
G-CLASS GROUND INSERTS

■IDEAL CHIP CONTROL EVEN IN THE LATTER HALF OF PASSES WHEN CONTINUOUS CHIPS ARE USUALLY PRODUCED. (M-CLASS INSERTS WITH 3-D CHIP BREAKERS)

ISO metric external thread pitch 1.5 mm Final pass (6th pass)

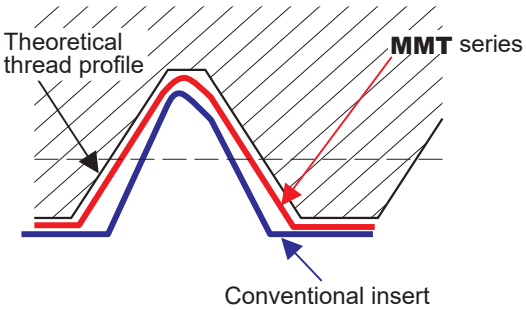
Competitor

MMT



<Cutting Conditions>
Work Material : AISI 4140
Insert : MMT16ER150ISO-S
Grade : VP15TF
Cutting speed : 395 SFM
Cutting method : Radial Infeed
Depth of cut : Fixed cut area
Pass : 6 times
Coolant : Wet

■A HIGHER LEVEL OF PRECISION THAN CONVENTIONAL INSERTS (G-CLASS GROUND INSERTS)

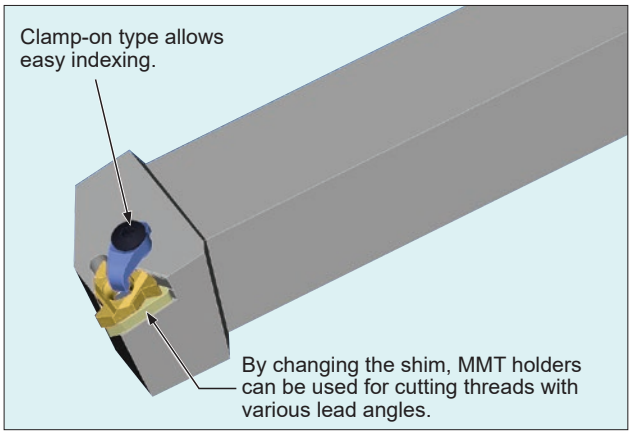


High precision threading can be achieved by using MMT inserts that feature a ground rake face and peripheral cutting edge.

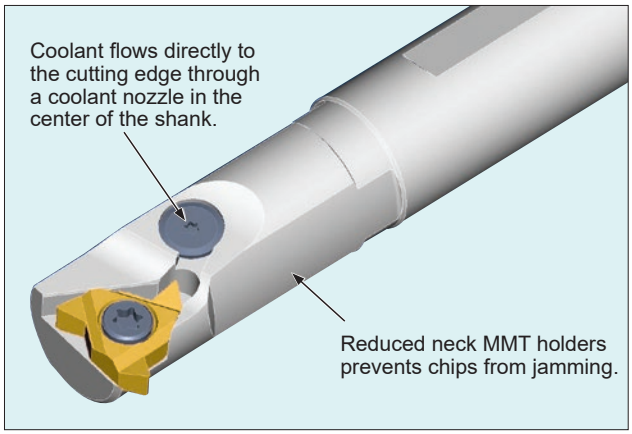
Thread Type	Threading Tolerance
ISO Metric	6g / 6H
American UN	2A / 2B
Whitworth for BSW, BSP	Medium Class A
BSPT	Standard BSPT
Round DIN 405	7h / 7H
ISO Trapezoidal 30°	7e / 7H
American ACME	3G
UNJ	3A
API Buttress Casing	Standard API
API Rounded Casing & Tubing	Standard API RD
American NPT	Standard NPT
American NPTF	Class2

■HOLDER (Use of special surface treatment)

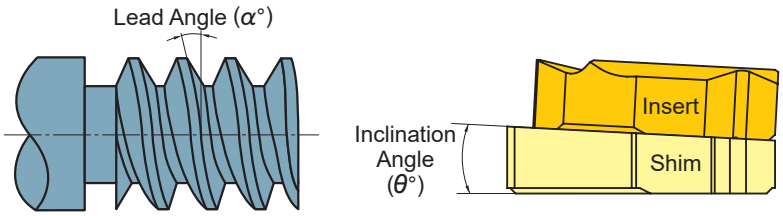
External



Internal



■SUITABLE FOR THREADING WITH A LARGE LEAD ANGLE



By changing only the shim, MMT holders can be used for turning of threads with various lead angles as well as the turning of left hand threads.

Lead Angle (α°)	Inclination Angle (θ°)
−1.5°	−3°
−0.5°	−2°
0.5°	−1°
1.5°	0°
2.5°	1°
3.5°	2°
4.5°	3°

Standard shim delivered with the holder.

■GRADE

VP10MF (G-class ground insert only)

●Superior wear and plastic deformation resistance

- High wear and plastic deformation resistance for threading when maintaining the thread form is important. Suitable for continuous high precision machining with extensive tool life.
- Effective in combination with G-class inserts for high precision threading.

VP15TF (G-class ground insert, M-class insert with 3-D chip breakers)

●Wide versatility

- High fracture resistance during low rigidity applications such as bar feed machining. Able to withstand harsh conditions for long periods where conventional inserts would be liable to breakage.
- Effective combination of high cost performance M-class inserts with 3-D chip breakers.

VP20RT (M-class insert with 3-D chip breakers)

●Excellent fracture resistance

- Suitable for stainless steel boring and unstable machining where inserts are vulnerable to fracturing.
- Effective combination of high cost performance M-class inserts with 3-D chip breakers.

■CHOOSING M-CLASS INSERTS WITH 3-D CHIP BREAKERS OR G-CLASS INSERTS

Insert	Chip control	Precision of thread
M-class inserts with 3-D chip breakers 	◎	○

Insert	Chip control	Precision of thread
G-class inserts 	○	◎

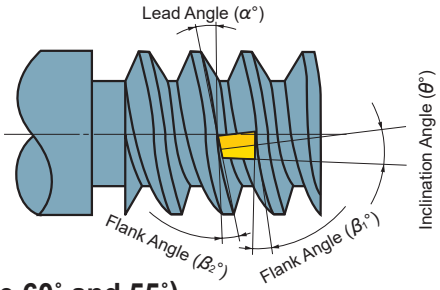
- For ideal chip control and a high cost performance ratio, M-class inserts with 3-D chip breakers are recommended.
- G-class inserts are recommended where higher precision is required.

CUTTING CONDITIONS OF MMT SERIES

SELECTING A SHIM FOR THE MMT SERIES

■FLANK ANGLE AND LEAD ANGLE

Lead angle (α) depends on a combination of thread diameter and pitch. Select a shim so that the lead angle of the thread can coincide with the flank angles of the thread and insert (β_1, β_2). No need to change a shim for general threading with an MMT holder. When threading with a small diameter or large pitch, change the shim depending on the lead angle, referring to the table and graph below. When threading left hand threads, change to a shim with a negative inclination angle.



■SHIM REFERENCE TABLE (THREADING DIAMETER) (Thread angle 60˚ and 55˚)

Lead Angle / Pitch (mm)	Right Hand Thread (mm)						Left Hand Thread (mm) *

* Back turning in the case of left hand threads.

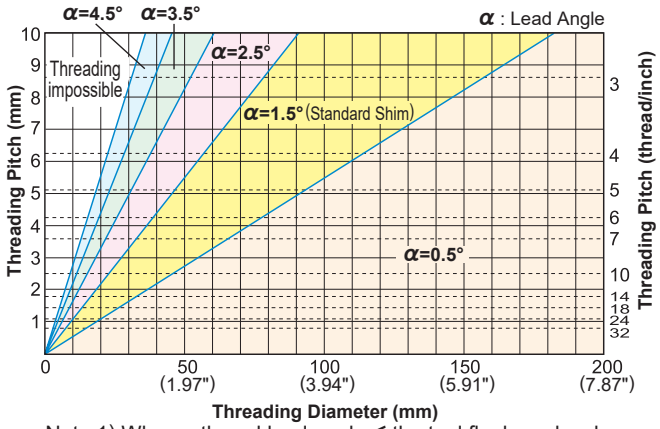
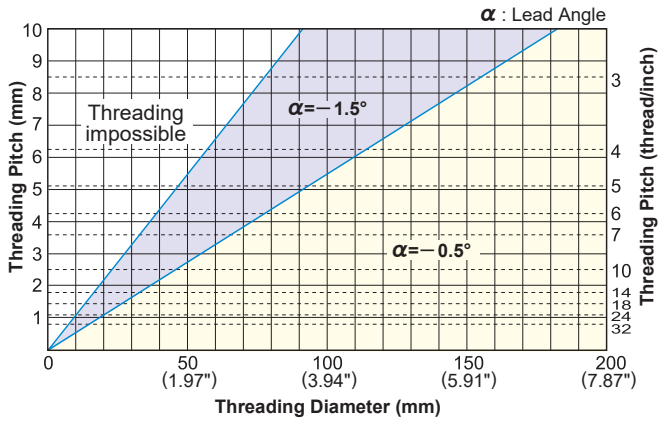
■ SHIM REFERENCE GRAPH (Thread angle 30° and 29°)

Right Hand Thread



Left Hand Thread



Note 1) When a thread lead angle ≤ the tool flank angle, change the shim to prevent side interference with the insert.
(Refer to the table below for the calculation of thread lead angle and tool flank angle.)

■ Selection table

* Back turning in the case of left hand threads.

When replacing a shim, check if the difference between the thread lead angle and shim inclination angle is within:
2.5°−0.5° where thread helix angle is 60° (55°)
2°−1° where thread helix angle is 30° (29°)
∗ Inclination angle of a standard shim is 0°.
∗ The holder has a 1.5° lead angle.

■ CALCULATION OF THREAD LEAD ANGLE

$$\tan\alpha = \frac{l}{\pi d} = \frac{nP}{\pi d}$$

α : Lead angle
l : Lead
n : Number of threads
P : Pitch
d : Effective diameter of thread

■ EXAMPLE OF SELECTING A SHIM

- When the thread lead angle is 2.2°
  ①In the case when the thread helix angle is 60°
  (2.2° lead angle) − (2.5−0.5°) = -0.3°−1.7° shim inclination angle is appropriate.
  Threading with a standard shim (0° inclination angle) is possible. But, replacing with a shim with a 1° inclination angle is recommended, refer to Standard Shim List on pages G021 and G026.
  ②In the case when the thread helix angle is 30°
  (2.2° lead angle) − (2−1°) = -0.2°−1.2° shim inclination angle is appropriate.
  Replacing with a shim with a 1° inclination angle is recommended, referring to Standard Shim List on pages G021 and G026.

■ RELIEF ANGLE OF AN INSERT SET ON A HOLDER

Thread Helix Angle	Internal Relief Angle	External Relief Angle
60°	8.8°	5.8°
55°	7.9°	5.2°
30°	4.1°	2.7°
29°	4°	2.6°

- Relief angles (β_2, β_1) of an insert become small when the thread helix angle of a trapezoidal, round, or other thread is small. Take care when selecting a shim.

Note 1) · Set the finishing allowance on a diameter at approx. .004 inch when using a full form insert.
· Please note the cutting depth and the number of passes when a nose radius of a partial or semi-full form insert or of an internal threading insert is small to prevent damage to the insert nose.
· Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

Note 1) · Set the finishing allowance on a diameter at approx. .004 inch when using a full form insert.
· Please note the cutting depth and the number of passes when a nose radius of a partial or semi-full form insert or of an internal threading insert is small to prevent damage to the insert nose.
· Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

MMT 16 E R 050 ISO

Designation	Diameter of Inscribed Circle (mm)	Application	Hand of Tool
MMT	11 6.35 16 9.525 22 12.7	E External I Internal	R Right

Pitch			
050	0.5 mm	A	0.5—1.5 mm or 48—16 thread/inch
075	0.75 mm		
100	1.0 mm		
125	1.25 mm	G	1.75—3.0 mm or 14—8 thread/inch
150	1.5 mm		
175	1.75 mm		
200	2.0 mm	AG	0.5—3.0 mm or 48—8 thread/inch
250	2.5 mm		
300	3.0 mm		
350	3.5 mm		
400	4.0 mm	N	3.5—5.0 mm or 7—5 thread/inch
450	4.5 mm		
500	5.0 mm		

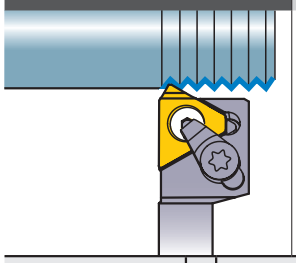
Threading Type	
60	Partial Profile 60°
55	Partial Profile 55°
ISO	ISO Metric
W	Whitworth for BSW, BSP
BSPT	BSPT
UN	American UN
RD	Round DIN 405
TR	ISO Trapezoidal 30°
ACME	American ACME
UNJ	UNJ
APBU	API Buttress Casing
APRD	API Round Casing&Tubing
NPT	NPT
NPTF	NPTF

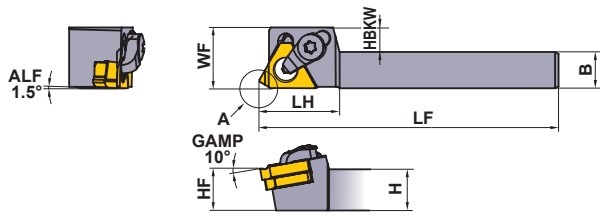
MMTE HOLDER

- Various insert types.
- Precision class insert for precise thread forms.
- Available with a pressed breaker for chip control.
- Able to change lead angle by replacing the shim.

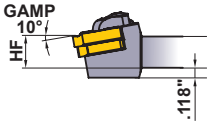
MMTE

External threading





Details of position A
Refer to the insert standards for dimensions PDX and PDY.



MMTER-063SM

Right hand tool holder only.

G

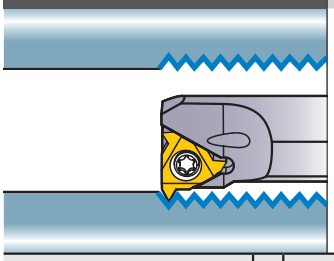
THREADING

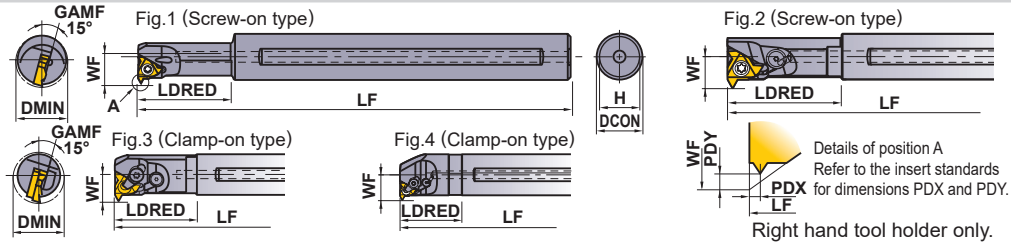
MMTI TYPE BORING BARS

- Minimum cutting diameter .500".
- Various insert types.
- Precision class insert for precise thread forms.
- Available with a pressed breaker for chip control.
- Able to change lead angle by replacing the shim.

MMTI

Internal threading





Right hand tool holder only.

Note 1) Select and use an alternate shim from list below (sold separately), dependant on the lead angle.
- The screw-on type has no shim. The holder has an in-built lead angle. Please select a holder with the appropriate lead angle.
- The minimum cutting diameter (DMIN) indicates the prepared hole diameter, not the nominal thread diameter.

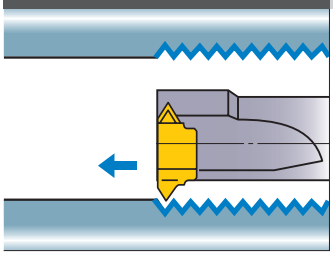
CUTTING DEPTH GUIDE ➤ G017

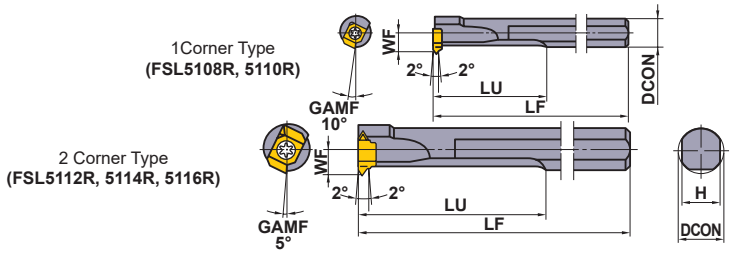
F TYPE BORING BARS

- Minimum cutting diameter 10 mm.
- Screw-on type.
- Applicable to threading, grooving.
- Thread pitch 1.5—3.5 mm.

FSL51 Internal threading, Grooving



Note 1) Cutting in the opposite direction is not possible.



Right hand tool holder only.

Order Number	Stock	Insert Number		Dimensions (mm)						*2

* Even though the pitch maybe the same, the depth of cut varies according to the corner radius. For the Micro Mini Twin CT type CT03RS-M4, and CT03RS-M4B the corner radius is 0.03 mm(.0012 inch), for other types it is 0.05 mm(.0020 inch). For further details please refer to the standards section.

● : USA Stock

<MICRO-MINI TWIN is available in 1 piece in one pack>

*1 For holder details, refer to Boring Bar Section page E034—E038.
Note 1) Mitsubishi Materials obtained the makers' approval before entering their names in the list.

RECOMMENDED CUTTING CONDITIONS

	Work Material	Cutting Speed (SFM)	Recommended Tool Overhang (mm)
P	Carbon Steel Alloy Steel	100—260	M	Stainless Steel	100—260	
K	Cast Iron	100—260	
N	Non-Ferrous Metal	165—330	

Note 1) Wet cutting is recommended.
Note 2) Pay special attention to machining of small diameters at high revolutions as the feed rate cannot keep up with the speed.

Memo

HOW TO READ THE STANDARD OF HSK-T TOOLS

●How this section page is organized

①Organized by application. (Refer to the index on the next page.)

PRODUCT TYPE
indicates the first four letters of the order number, as well as cutting applications.

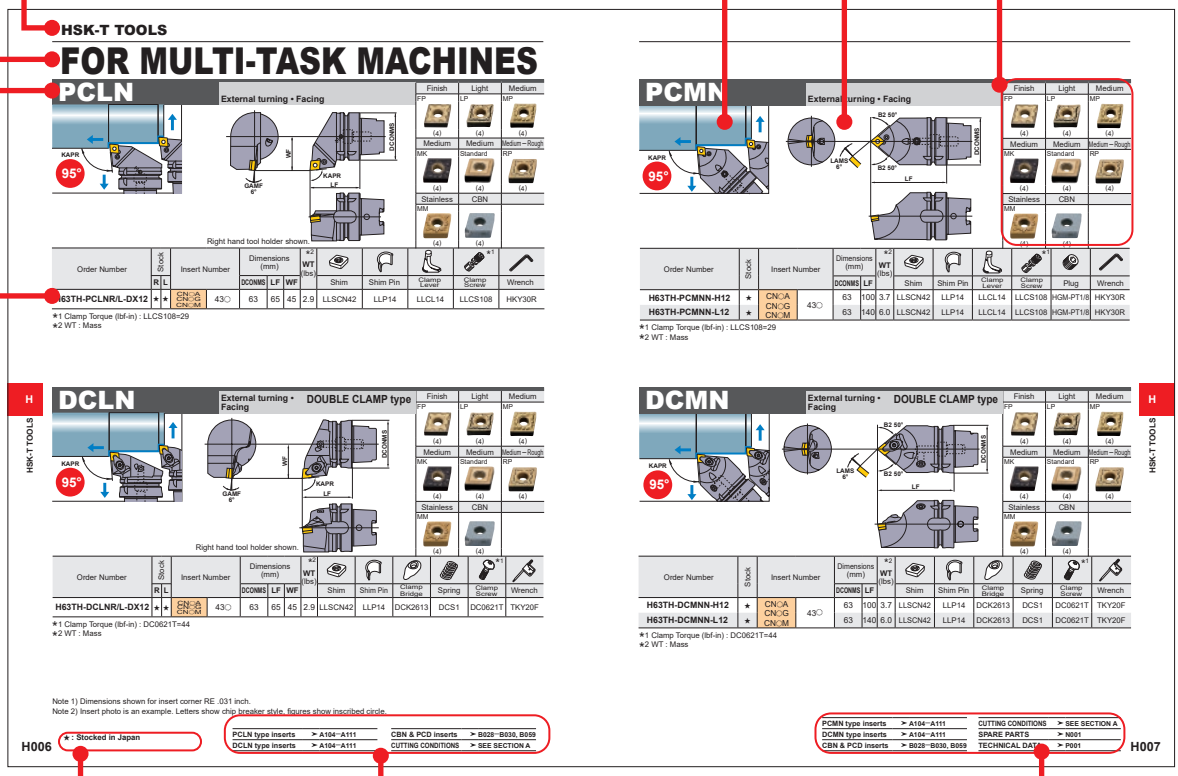
TITLE OF PRODUCT SERIES

PRODUCT SECTION

FIGURE SHOWING THE TOOLING APPLICATION
uses illustrations and arrows to depict available machining applications along with cutting edge lead angles.

GEOMETRY

CHIP BREAKER BY CUTTING APPLICATION



LEGEND FOR STOCK STATUS MARK
is shown on the left hand page of each double-page spread.

REFERENCE PAGE FOR APPLICABLE INSERTS
indicates reference pages for details of inserts that are applicable to the title product.

PAGE REFERENCE
·SPARE PARTS
·TECHNICAL DATA
indicates reference pages, including the above, on the right hand page of each double-page spread.

PRODUCT STANDARDS
