

Q3 & Q5 TURRET PUNCH

The Haco R & D Department has produced a new line of innovative CNC Turret punch machines.

The Q3 & Q5 Turret punch models are now available.

The Q3 model can process plates of 60" x 80" and the Q5 model can handle plate dimensions of 60" x 100" without repositioning. These models are now integrated with bending & punching solutions and have been improved with an amazing high speed index axis at 250 RPM and an oversized part chute. The fastest tool changes in the industry are achieved with our external tool turret (punch- and die-holder). The active punch/die combination is active outside the turret, thus avoiding the traditional wear of the punch-holder and the turret (traditional on classic punching machines). With a rotating punching head, all tools can be indexed, reducing the number of tools as well as tool changes to produce the part. Furthermore, all tools (within their holder) can be put in any station of the turret (excluding complex turret configurations)
