CARBIDE, 3-FLUTE STANDARD LENGTH – DLC COATED

- ▶ Balanced cutting with less vibration
- ▶ Ability to run at higher speeds with less heat in aluminum
- ▶ More efficient chip evacuation
- ▶ Ability to counteract extreme radial forces
- ▶ DLC Coating provides edge strength and unsurpassed tool life

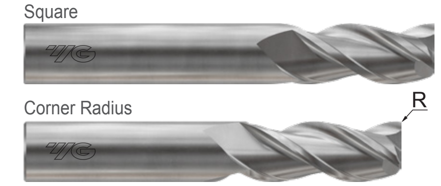
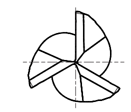
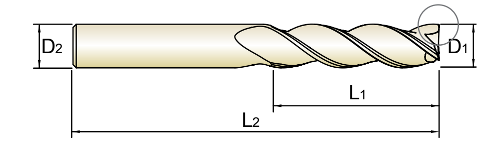
YG ALU-POWER HPC END MILLS
SQUARE E5G95 SERIES
CORNER RADIUS E5G97 SERIES

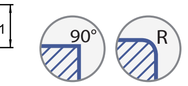
CARBIDE, 3-FLUTE STANDARD LENGTH – UNCOATED

- ▶ Balanced cutting with less vibration
- ▶ Ability to run at higher speeds with less heat in aluminum
- ▶ More efficient chip evacuation
- ▶ Ability to counteract extreme radial forces









p.C600

ALU-POWER HPC END MILLS

CORNER RADIUS **JAI38 SERIES**

CARBIDE, 3-FLUTE STANDARD LENGTH - CHIP BREAKER - DLC COATED

- ▶ Balanced cutting with less vibration
- ▶ Ability to run at higher speeds with less heat in aluminum
- ▶ Chip Breaker Improves chip evacuation by shortening the chip length
- ▶ Ability to counteract extreme radial forces
- ▶ DLC Coating provides edge strength and unsurpassed tool life

NOTES:
- All cutting data are target values
- Maximum recommended depth shown
- Finish cuts typically require reduced feed rates and/or higher spindle speed, with radial width of 2% x D or less
- Reduce speed and feed recommendations for materials harder than listed
- Reduce cut depth and feed by 50% for long-flute or long-reach tools
- Above recommendations are based on ideal conditions. Adjust parameters accordingly for smaller taper machining centers or less rigid conditions
- HSM = high-speed machining

- Finish cuts typically require reduced feed rates and/or higher spindle speed, with radial width of 2% x D or less
- Reduce speed and feed recommendations for materials harder than listed
- Reduce cut depth and feed by 50% for long-flute or long-reach tools
- Above recommendations are based on ideal conditions. Adjust parameters accordingly for smaller taper machining centers or less rigid conditions
- HSM = high-speed machining

Tech Tip : The tables above are based on common machining calculations.
We realize that shops may not have RPM capability shown in the tables
To adapt the tables to machining conditions available, use the following calculation:
(Recommended Feed (IPM) / Recommended RPM) X Available RPM = IPM
Example for 1/8" Side Milling in N21-22 WorkPiece Materials:
(275 IPM / 91700 RPM) X 15,000 = 45 IPM

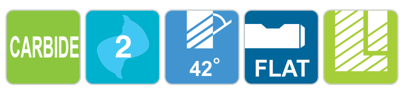
YG ALU-POWER END MILLS

FLAT SHANK **E5253** SERIES

CARBIDE, 2 FLUTE 42° HELIX REGULAR LENGTH - "BANSHEE"

- High velocity milling of aluminum & other non ferrous materials.
- Excellent plunging capabilities.
- Improved surface roughness-cylindrical margin which is controlled tightly.
- Maximum-metal removal rate.
- Superior chip evacuation.
- Mirror face-excellent surface finish.



p.C636

0~-.0012	0~-.0003

- High performance in machining aluminum and non-ferrous materials
- Special designed geometry with high rigidity cutting edge
- Improved surface roughness - cylindrical margin which is controlled tightly.
- Excellent chip removal - higher rake angle, higher helix angle(42°), bigger chip pocket.

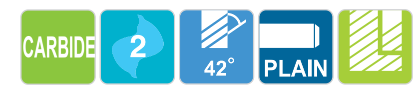
YG ALU-POWER END MILLS

PLAIN SHANK **E5254** SERIES

CARBIDE, 2 FLUTE 42° HELIX REGULAR LENGTH - "BANSHEE"

- High velocity milling of aluminum & other non ferrous materials.
- Excellent plunging capabilities.
- Improved surface roughness-cylindrical margin which is controlled tightly.
- Maximum-metal removal rate.
- Superior chip evacuation.
- Mirror face-excellent surface finish.



p.C636

0~-.0012	0~-.0003

- High performance in machining aluminum and non-ferrous materials
- Special designed geometry with high rigidity cutting edge
- Improved surface roughness - cylindrical margin which is controlled tightly.
- Excellent chip removal - higher rake angle, higher helix angle(42°), bigger chip pocket.

- High performance in machining aluminum and non-ferrous materials
- Special designed geometry with high rigidity cutting edge
- Improved surface roughness - cylindrical margin which is controlled tightly.
- Excellent chip removal - higher rake angle, higher helix angle(45°), bigger chip pocket.

PLAIN SHANK **EP922 SERIES**

HSS-PM, 3 FLUTE 42° HELIX SHORT LENGTH ROUGHING for ALUMINUM

- ▶ Maximum stock removal rates at High Speed Condition.
- ▶ Reduces vibrations and improves surface roughness.

HSS-PM ALU 3 42° PLAIN p.C645

YG D-POWER GRAPHITE END MILLS

PLAIN SHANK **EI107** SERIES

CARBIDE, 4(2) FLUTE REGULAR LENGTH

- ▶ Higher hardness of film and excellent wear-resistance increase the tool life dramatically.
- ▶ Ultra fine film of YG-1's diamond coated carbide end mills ensure the smooth and excellent surface on work materials.
- ▶ High performance on graphite, wrought aluminum, bakelite, plastics, wood, brass, etc.
- ▶ YG-1's diamond coated carbide end mills may have good result for the machining of non-ferrous metals and non-metallic materials.

D-POWER GRAPHITE END MILLS

PLAIN SHANK **EIB05 SERIES**

CARBIDE, 4 FLUTE REGULAR LENGTH CORNER RADIUS

- ▶ Higher hardness of film and excellent wear-resistance increase the tool life dramatically.
- ▶ Ultra fine film of YG-1's diamond coated carbide ball end mills ensure the smooth and excellent surface on work materials.
- ▶ High performance on graphite, wrought aluminum, bakelite, plastics, wood, brass, etc.
- ▶ YG-1's diamond coated carbide ball end mills may have good result for the machining of non-ferrous metals and non-metallic materials.

YG CARBIDE END MILLS

FLAT SHANK **E5024** SERIES

CARBIDE, 4 FLUTE REGULAR LENGTH DOUBLE

- Same construction features as single end mill in a more economical version.
- Suitable for cutting hardened & high alloy steels, steel casting, chill casting, malleable cast iron, CrNi-steels, brass, copper, aluminum with a high percentage of silicon and abrasive plastics.

CARBIDE 4 30° FLAT p.C714, C715

CARBIDE, 3 FLUTE 45° HELIX REGULAR LENGTH

- ▶Designed to machine stainless steel, inconel, titanium and other hard to machine materials.
- ▶It's 3 flute design gives high stability and allows good chip removal in plunging & slotting operations.
- ▶The normal rake angle and 45° medium helix allows an extremely wide range of application.
- ▶YG:TYLON super TiAlN coating are recommended for maximum performance.

PLAIN SHANK **E5078** SERIES

CARBIDE, 3 FLUTE TAPER BALL NOSE

▶Designed for milling die cavity.
▶Many different center line angles are available on your job requirement.

CARBIDE | 3 | 30° | R ±.0008 | PLAIN p.C708

TANK-POWER END MILLS

FLAT SHANK **E9988** SERIES

PREMIUM HSS-PM, 3&4 FLUTE 60° HELIX REGULAR LENGTH

▶ Faster feed & speed than normal HSS can be applied to hardened steels up to Rc 45. Accordingly, HSS-PM made by powder metallurgy makes much higher productivity possible.

HSS-PM | 3&4 | 60° | FLAT | p.C759

TANK-POWER END MILLS

FLAT SHANK **E9992** SERIES

PREMIUM HSS-PM, 2 FLUTE REGULAR LENGTH BALL NOSE

▶ The two flute ball end mills are designed for milling of radius bottom slots, fillets and special contours. The end teeth are cut to center allowing these end mills to drill into material at the beginning of a slotting cut. The two flute design provides good chip removal ability in slotting.

HSS-PM | 2 | 30° | R ±.001 | FLAT | p.C761

TANK-POWER END MILLS

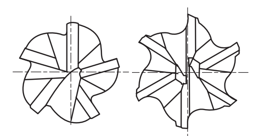
FLAT SHANK **E9921** SERIES

PREMIUM HSS-PM, MULTI FLUTE FINE PITCH ROUGHING EXTENDED NECK CENTER CUTTING

▶ This TANK-POWER rougher is designed for high production metal removal in a wide range of work piece material. It is suitable for a very broad spectrum of materials having up to high tensile strengths.



p.C760

YG COBALT & HSS END MILLS

8% COBALT (M42) FLAT SHANK **E2030 SERIES**
HSS (M2) FLAT SHANK **E1030 SERIES**

HSSCo8 & HSS, 2 FLUTE REGULAR LENGTH

▶ These end mills are furnished as regular with right-hand cutting and right-hand helical flutes. All shanks are flatted for holder set screw. These are designed for slotting, drilling, pocketing and general-purpose operation.

COBALT & HSS END MILLS

8% COBALT (M42) FLAT SHANK **E2110** SERIES
HSS (M2) FLAT SHANK **E1110** SERIES

HSSCo8 & HSS, 2 FLUTE REGULAR LENGTH BALL NOSE

▶ The two flute ball end mills are designed for milling of radius bottom slots, fillets and special contours. The end teeth are cut to center allowing these end mills to drill into material at the beginning of a slotting cut. The two flute design provides good chip removal ability in slotting.

HSSCo8 & HSS, 6 FLUTE REGULAR LENGTH CENTER CUTTING

▶ Center cutting allows these end mills to drill into the part for the beginning of a slot.
These center cutting end mills are recommended for pocketing, tracer milling, cam milling, die sinking and slotting.

COBALT & HSS END MILLS

8% COBALT (M42) FLAT SHANK **E2100** SERIES
HSS (M2) FLAT SHANK **E1100** SERIES

HSSCo8 & HSS, 6 FLUTE REGULAR with COMBINATION 2″ SHANK CENTER CUTTING

▶ These are to be used for heavy hogging cuts in die-sinking, tape & tracer controlled milling and similar work.
The Heavy-Duty end mills are made with toughened Combination shank, heavy web construction, accurate machine-ground end-teeth notching and a special surface treatment to reduce cutting-edge wear.

COBALT & HSS END MILLS

8% COBALT (M42) PLAIN SHANK **E2001** SERIES
HSS (M2) PLAIN SHANK **E1001** SERIES

HSSCo8 & HSS, 2 FLUTE MINIATURE STUB LENGTH DOUBLE

▶ Tools under Miniature end mills have 3/16″ shank diameter without flats. They are designed with positive rake angle geometry and a high helix angle to insure free cutting action. The flute design provides good strength behind the cutting edge. Suitable for finishing of precision components such as watch, camera, electronic apparatus molds, etc.

YG COBALT & HSS END MILLS

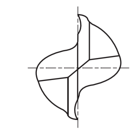
HSS (M2) FLAT SHANK **E1070** SERIES

HSS, 2 FLUTE 42° HELIX REGULAR & MEDIUM LENGTH for ALUMINUM

▶ The two flute end mills for aluminum have High Helix flute design making them well suited for milling aluminum and other non-ferrous materials. Special rake angles and low micro inch finishes on the primary clearance angles and flute faces insure free cutting action, fine finishes and longer tool life for both non-ferrous materials as well as harder alloys. These tools are made from regular HSS(M2), which is good for aluminum cutting.



HSS | 2 | 42° | FLAT

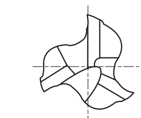
8% COBALT (M42) FLAT SHANK **E2191** SERIES

HSSCo8, 3 FLUTE 37° HELIX REGULAR LENGTH ROUGHING for ALUMINUM

▶ This general purpose rougher is designed for high production metal removal in a wide range of work piece material. It is suitable for a very broad spectrum of materials having up to high tensile strengths. In many cases, the milled surfaces are of acceptable quality.



p.C862

※ The Feed, in long & extra long types, should be reduced by around 50%.

NOTES :

(1) The cutting conditions in this table are given for reference, which should be varied depending on the machine, tooling, depth of cut. cutting fluid and other conditons.
(2) Use a holder of strong gripping force and machine of high stiffness

※ The Feed, in long & extra long types, should be reduced by around 50%.

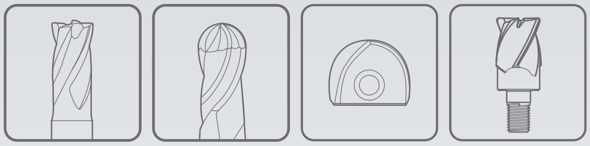
Global Cutting Tool Leader **YG-1**



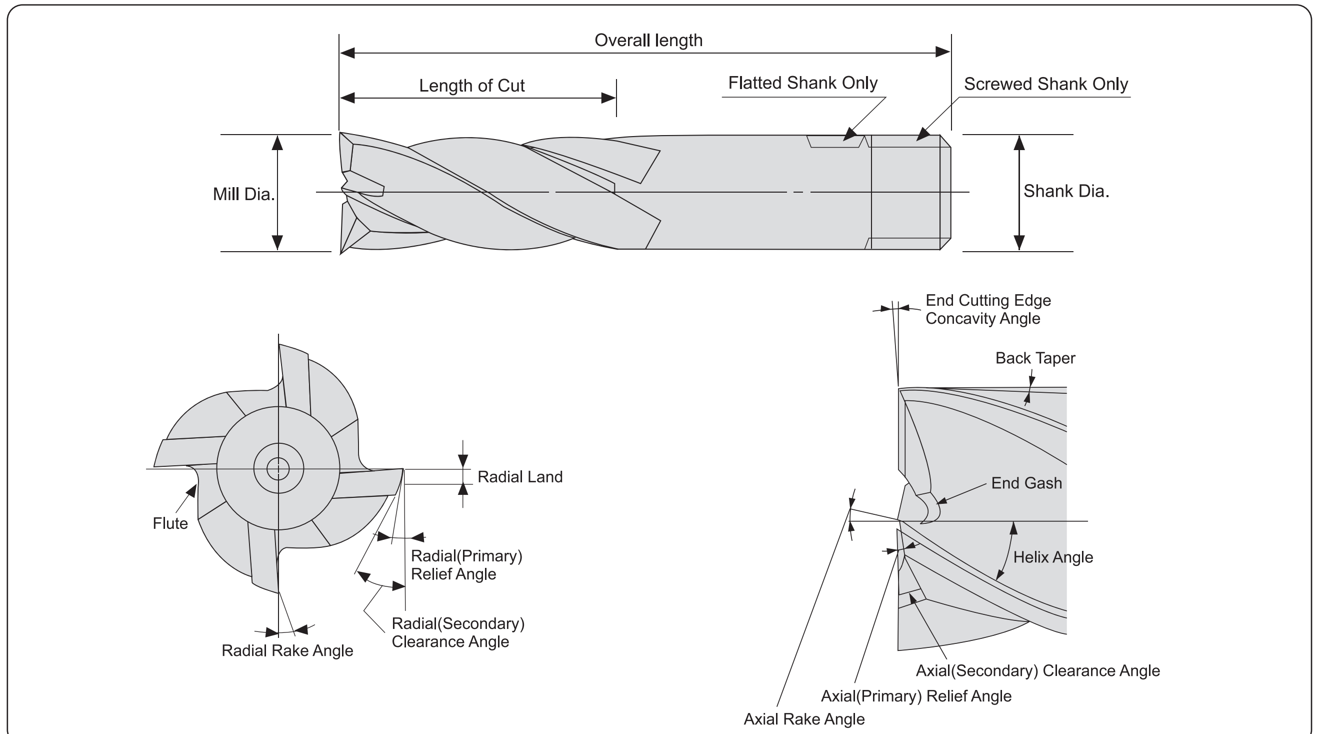
MILLING

Being the best through innovation

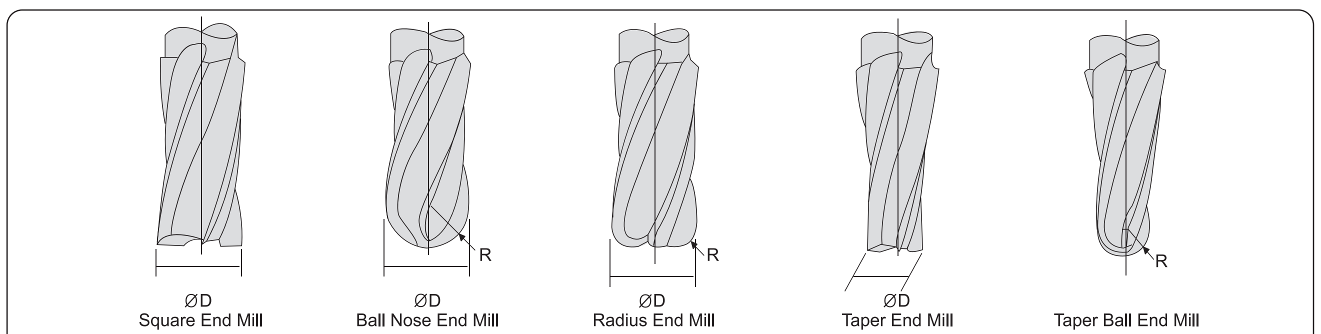
END MILLS

TECHNICAL DATA

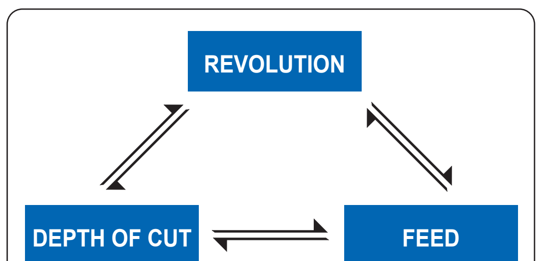
1 Names of End Mill Parts



2 Type of End Mill



Speed, feed and depth of cut are the most important factors to consider for best results in milling. Improper feeds and speeds often cause low production, poor work quality and unnecessary damage to the cutter.
This section covers the basic principles of speed and feed selection for milling cutters and end mills. It will serve as a guide in setting-up new milling jobs.



INTERRELATIONSHIP OF THREE FACTORS

YG TECHNICAL DATA
SUPER CUTTING END MILLS

3 Speeds

In milling, Speed is measured in peripheral feet per minute.(revolution per minute × cutter circumference in feet) This is frequently referred to as “peripheral speed” “cutting speed” or “surface speed”.

Revolutions per Minute $N = \dfrac{1000V}{\pi \times D}$

V : Cutting Speed(m/min)
D : Diameter of Tool(mm)
N : Revolution per minute(rev/min)
π : 3.1416

They will have to be tempered to suit the conditons ON THE JOB. For example:

Use Lower Speed Ranges for	Use Higher Speed Ranges for
Hard materials Tough materials Abrasive materials Heavy cuts Minimum tool wear Maximum cutter life	Softer materials Better finishes Smaller diameter cutters Light cuts Frail work pieces or set-ups Hand feed operations Maximum production rates Non-metallics

4 Feeds

Feed is usually measured in millimeters per minute. It is the product of feed per tooth times revolution per minute times the number of teeth in the cutter. Due to variations in cutter sizes, numbers of teeth and revolutions per minute, all feed rates should be calculated from feed per tooth. Feed per tooth is the basis of all feed rates per minute, whether the cutters are large or small, fine or coarse tooth, and are run at high or low peripheral speed. Because feed per tooth affects chip thickness. It is a very important factor in cutter life.
Highest possible feed per tooth will usually give longer cutter life between grinds and greater production per grind. Excessive feeds may over load the cutter teeth and cause breakage or chipping of the cutting edges. The following factors should be kept in mind when using the recommended starting feed per tooth.

Feed in milimeters per Minute
F.M = F.R.×R.P.M

F.R. : Feed per Revolutions in milimeters
R.P.M .: Revolutions per Minutes

The following factors should be kept in mind when using the recommended stating feed per tooth.

Use Higher Feeds For	Use Lower Feeds For
Heavy, roughing cuts Rigid set-ups Easy-to-machine work materials Rugged cutters Slab milling cuts Low tensile strength materials Coarse tooth cutters Abrasive materials	Light, and finishing cuts Frail set-ups Hard to machine work materials Frail and small cutters Deep slots High tensile strength materials Fine tooth cutters

Feed per Tooth=F.T.	Number of Teeth in Tool Feed in milimeters per Minute Speed in Revolution per Minute	=T =F.M. =R.P.M.	$F.T.=\frac{F.M.}{T\times R.P.M.}$

5 Case of Resharpening

When the product finish become worse, the cutting edge must get dulled, chips become smaller and the cutting sound gets louder. In such cases, an end mill must be resharpened. The following are the damages of end mills when the resharpening is required.

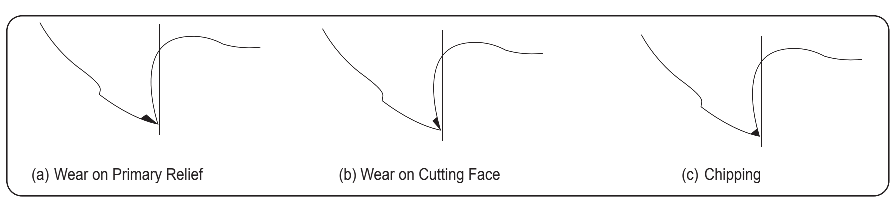

Fig. 1. Damages of Cutting Edge

6 Sharpen at Predetermined Wear Land

Cutters should be sharpened as soon as the wear land(Fig. 2.) reaches a predetermined width. This width should permit sharpening without excessive loss of tool life. It may vary from a few hundreths to some tenth of a millimeter, depending on the type of cutter and the finish required on the product. This method is used on production runs where uneven amounts of stock is removed or where the material varies in machinability. It is also used on small quantity product lots.

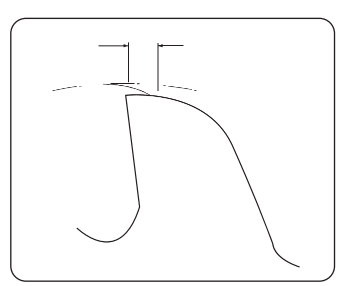

Fig. 2. Wear Land

YG TECHNICAL DATA SUPER CUTTING END MILLS

7 Resharpening Peripheral Cutting Edge

1 RESHARPENING PERIPHERAL CUTTING EDGE

The geometry of relief angle in an end mill consists of three methods as shown in Fig.3 concave, flat, and eccentric. Recently, most end mills have the eccentric relief(eccentric sharpening). In this method, since the relief is formed an eccentric are surface in cylindrical grinding method, the roughness of the finished surface of the relief improves and the strength of cutting edge increase at the same time.(Fig.4) As a result, the tool life is improved.

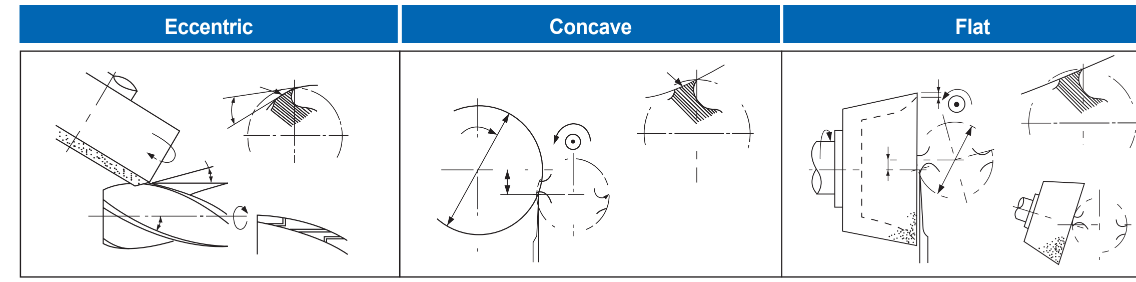

Fig. 3. Three Types of Primary Relief

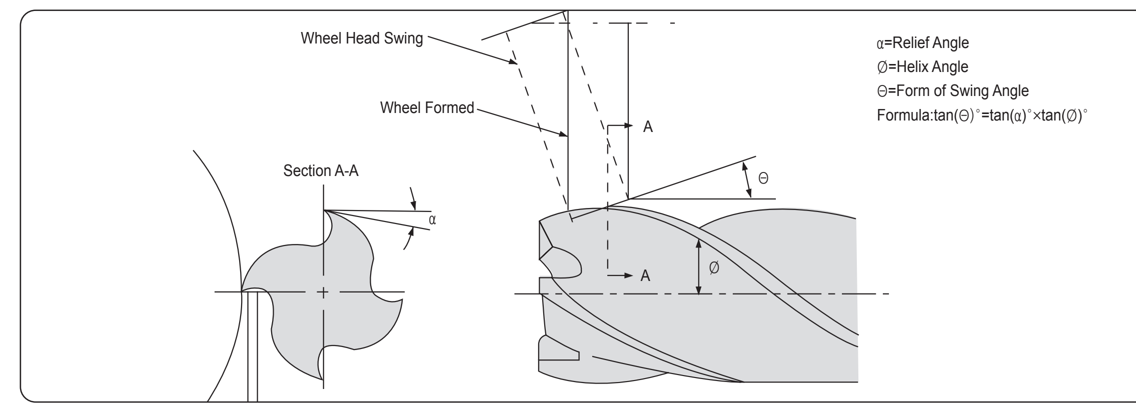

Fig. 4. Toothing of Eccentric Relief Angle

2 ANGLE OF WHEEL INCLINATION

Eccentric relief is produced with a plain wheel positioned with its axis parallel or at a slight angle with the cutter axis. The degree of relief is varied by changing the angle of wheel inclination.

Table 1. RECOMMENDED RELIEF ON END MILLS

Mill Diameter (inches)	Eccentric relief indicator drop for relief Angles shown		Checking Distance	Wheel Angles(Deg.)⊖			Radial Relief Angles(α1)	Clearance Angles(α2)
				15° Helix	30° Helix	60° Helix		
-	Min	Max.	-	*Angle	*Angle	*Angle	*Angle	*Angle
1/8	.0040	.0052	.015	4°42′	10°02′	27°58′	17°03′	25°
1/4	.0035	.0050	.020	3°15′	6°59′	20°12′	12°00′	25°
1/2	.0040	.0053	.025	2°51′	6°07′	17°51′	10°32′	25°
1	.0038	.0055	1/32	2°16′	4°54′	14°27′	8°27′	25°
1-1/2	.0033	.0050	1/32	2°02′	4°22′	12°57′	7°33′	25°
2	.0033	.0050	1/32	2°02′	4°22′	12°57′	7°33′	25°

The actual at the radial relief angle is normally kept within the range shown but may be varied to suit the cutter material, the work material and the operating conditions.
* Angle is calculated from the basic mean at the radical angle.

8 Resharpening End Teeth

The three necessary operations and one option feature, along with setup suggestions are shown in Fig.5 A to D in each drawing, the shaded area indicates the surface being ground.

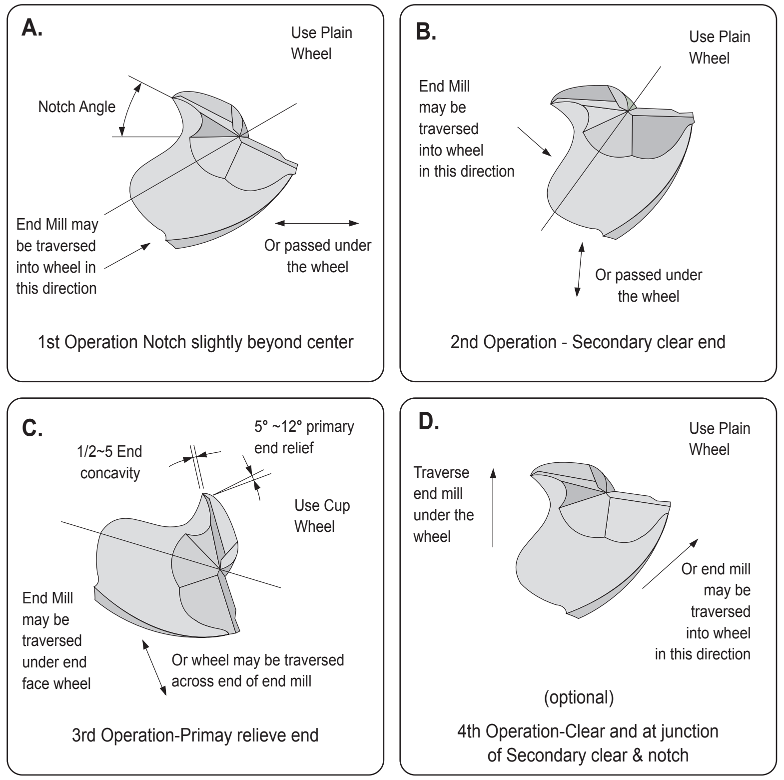

Fig 5. PROCEDURE FOR SHARPENING END OF 2 FLUTE SQUARE END MILLS

9 Inspection

The inspection is calculated by using the formula shown in Table1.
Procedure To Check
Radial Relief Angles
With Indicators.

1. Mount the cutter to rotate freely with no end movement.
2. Adjust the sharp pointed indicator to bear at the very tip of the cutting edge, pointing in a radial line, shown in Figure6
3. Roll the cutter the tabuleted amount gives under “checking distance” using the second indicator as control.
4. Consult chart for amount of drop for the particular diameter and relief angle.

SUPER CUTTING END MILLS

16 Troubleshooting in Endmilling

Trouble	Occurrences of trouble	Countermeasures
Breaking of tool	• At time of engaging with work material • When ending cut	1. Decrease feed rate. 2. Decrease projection amount 3. Shorten cutting edge length to required minimum limit
	• During normal cutting	1. Decrease feed rate 2. Control wear → replace tool early 3. Replace chuck or collet 4. Decrease projection amount 5. Carry out honing 6. If 4 flute, reduce to 2 flute(clogging of chipping) 7. If dry cutting change to wet cutting utilize cutting fluid. In case of wet cutting flow oil supplied from the front, change to from rear angle of side top. Use ample with rate.
	• When changing direction of feed	1. Utilize circular interpolation(in case of NC machine) or temporarily stop feed(Dowelling) 2. Reduce feed rate before and after change of directions 3. Replace chuck or collect
Fracture of cutting edge	• Fracture of corners	1. Carry out chamfering or nose with hand lapper. 2. Down cut → Up cut
	• Fracture at boundary of depth of cut	1. Down cut → Up cut 2. Reduce cutting speed
	• Chipping at center part or overall	1. Carry out honing. Or enlarge. 2. Change number of rotation(in case machine vibrates) 3. Increase cutting speed 4. In ease of squeaking noise during cutting, increase feed. 5. It dry cutting use cutting fluid or blow air. 6. Replace chuck or collet 7. Reduce cutting speed
	• Large fracturing of cutting edge	1. Decrease feed rate 2. If 4 flute reduce to 2 flute 3. Carry out honing. Or enlarge 4. Replace chuck or collet 5. Reduce cutting speed 6. If dry cutting, change to wet cutting. In case oil supply in wet cutting is from the front, change to rear at an angle or from side top. Use ample supply.
Rapid tool wear		1. Reduce cutting speed 2. Up cut → Down cut 3. Increase feed 4. Utilize wet cutting or air 5. If reground tool, improve surface roughness of flank.

SUPER CUTTING END MILLS

Trouble	Occurrences of trouble	Countermeasures
Inferior finished surface	• Surface is good but rough	1. Decrease feed 2. In case using 2 flute, increase to 4 flute
	• Small chip welding	1. Increase cutting speed 2. Utilize wet cutting air blow(ample supply) 3. Carry out fine honing 4. Up cut → Down cut 5. Increase feed or enlarge finish allowance
	• With transverse streaks	1. Carry out fine honing 2. Use water insoluble cutting fluid 3. Down cut → Up cut
	• Signs of excessive cutting	1. Reduce finishing depth of cut 2. Increase cutting speed 3. Reduce feed
Poor machining accuracy	• Finish dimensions are on minus side	1. Up cut → Down cut 2. Reduce finishing depth of cut 3. Replace chuck or collet 4. Reduce projection amount 5. Increase cutting speed
	• Poor perpendicularity	1. Reduce finishing depth of cut 2. Replace chuck or collet 3. Reduce projection amount 4. Increase cutting speed 5. 2Flute → 4 Flute 6. Reduce feed 7. Check wear rate → Replace tool
Chattering		1. Increase feed rate(in case over 0.05 mm/Zahn, try reducing) 2. Change cutting speed 3. Replace chuck or collet 4. Reduce projection amount 5. Use 2 flute cutter for rough cutting and 4 flute for finishing 6. Down cut → Up cut

* Other special sizes of Hydraulic Chuck collets can be supplied on request.

Feature Hydraulic Chuck collet(reduction sleeve) is cut into trisection by high precision cutting to guarantee precise I.D and strong clamping power.(The most economical Solution)

Chucking Method Please assemble cutting tool with collet first, and then insert collet into Hydraulic Chuck.

* BT(JIS B6339/MAS-403), HSK(DIN 69893/ISO 12164-1) and STRAIGHT-K Taper products are available.
For details, please discuss separately.

Feature
- To compensate for synchronization errors to extend tap life and to improve thread quality
- To compensate for pitch tolerances of taps
- For machine with synchronized spindle

* Suffix "C" in MODEL No. is through coolant type.
* Improper selection of pull studs can cause serious damage and possible injury.
  Please make sure the machine accepts the pull stud you select.

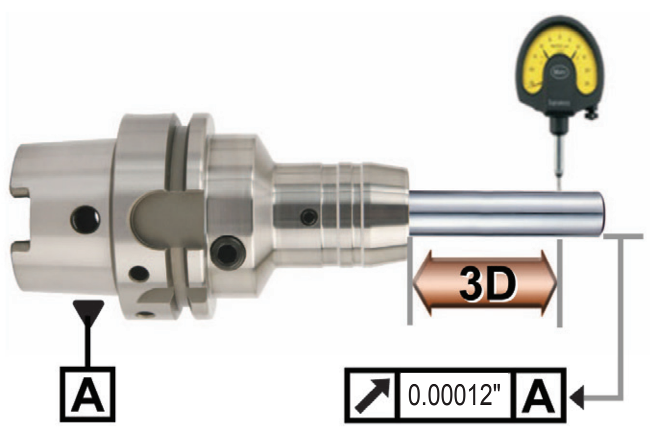
TECHNICAL INFORMATION

YG TECHNICAL INFORMATION

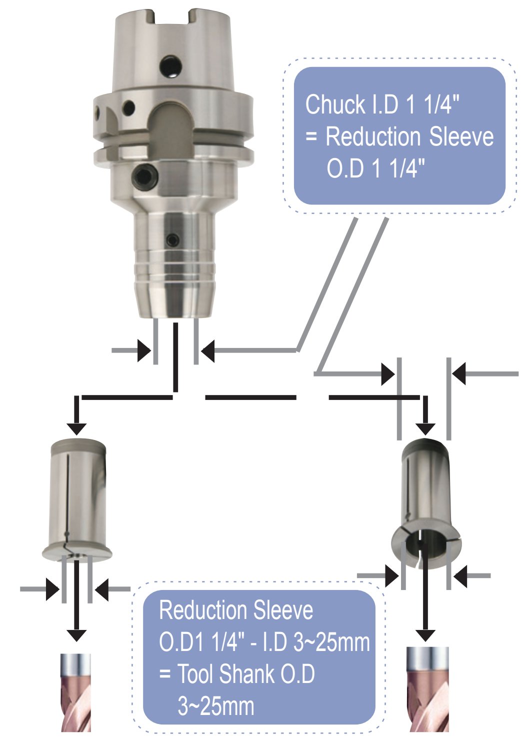
TECHNICAL INFORMATION (HYDRAULIC CHUCK)

High precision T.I.R : ≤ 0.00012" (Without Reduction Sleeve)

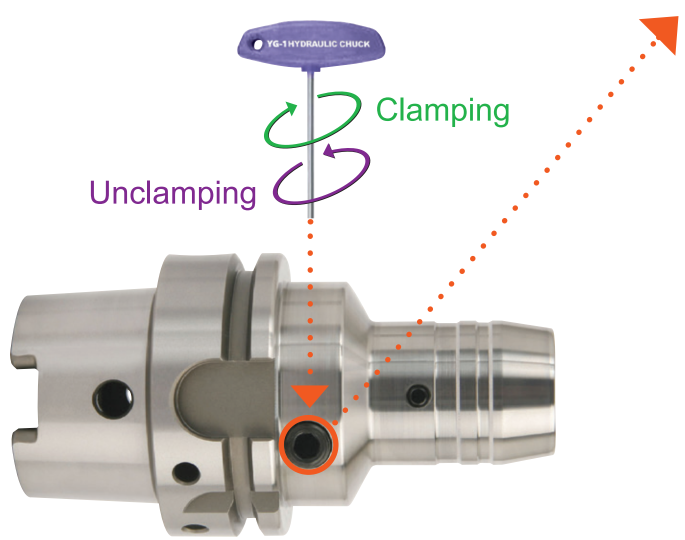


• Less than 0.00012" T.I.R
⇒ Suitable for high-speed precision machining

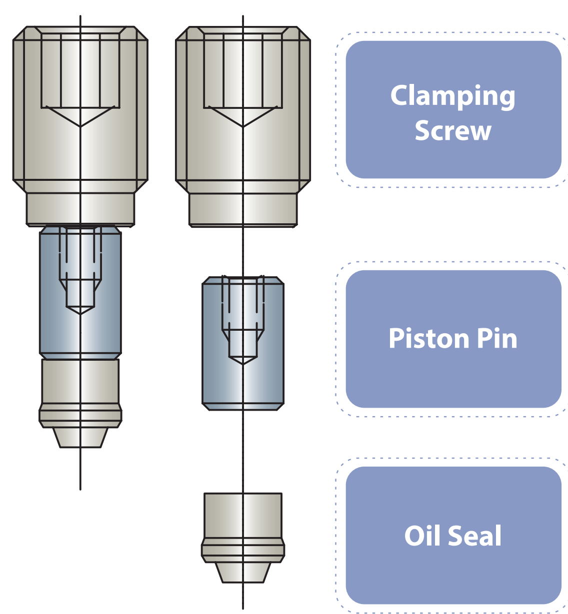
Flexible use of cutting tools by using reduction sleeves



Easy Tool Change



CLAMPING SCREW



• Easy clamping and unclamping by use of T wrench
⇒ Reducing tool change time

ROTARY TOOL HOLDERS

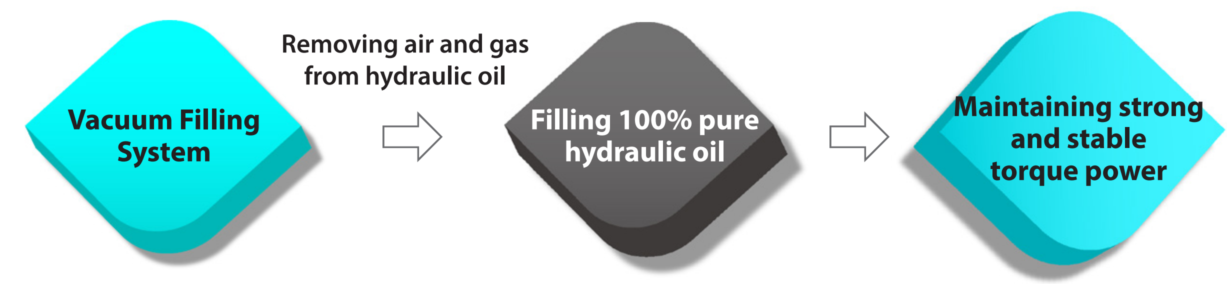
YG TECHNICAL INFORMATION

TECHNICAL INFORMATION (HYDRAULIC CHUCK)

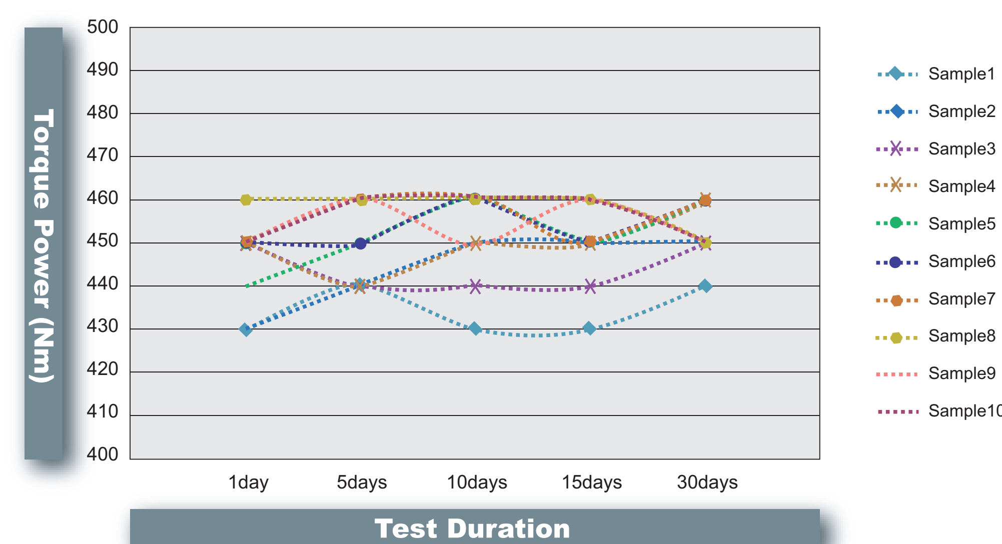
Strong Torque Power

Hydraulic Chuck I.D(mm)	Tool Shank O.D(mm)	Applicable RPM	Minimum Clamping Depth (mm)		Min. Torque Power (Nm)	
			Slim	Power E Hydro	Slim	Power E Hydro
6	6	40,000	27		16	
8	8	40,000	27		23	
10	10	40,000	32		45	
12	12	40,000	37	41	90	110
14	14	40,000	37		110	
16	16	40,000	42		185	
18	18	40,000	42		240	
20	20	40,000	42	48	330	520
25	25	25,000	48		400	
32	32	25,000	55	57	650	900

• Tool Holder I.D Tolerance : H6
• Operating Temperature : 20~25℃
• Maximum pressure of coolant oil : 80bar



Test of Torque Power and Hydraulic Oil Leakage



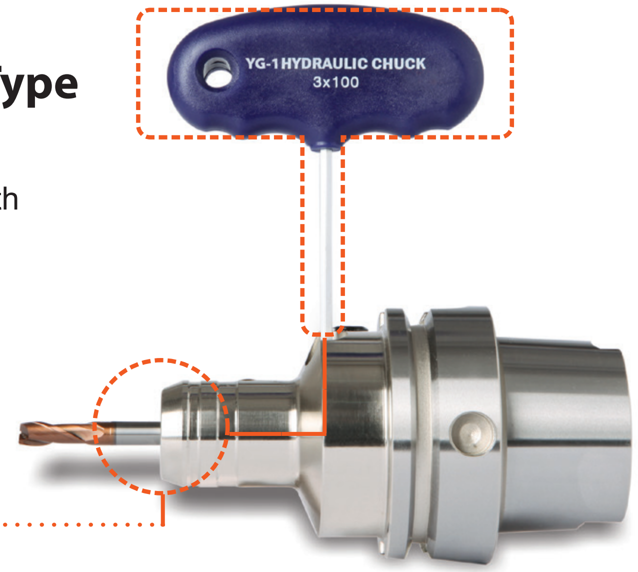
• Test Model : BT40AD/B-HC20-90
• No oil leakage for long period ⇒ Maintaining stable torque power

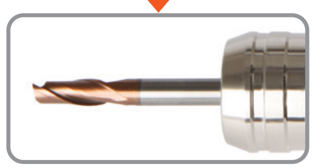
YG TECHNICAL INFORMATION

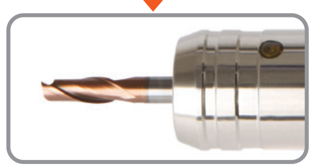
TECHNICAL INFORMATION (HYDRAULIC CHUCK)

Radial Tool Length Pre-setting Type

- Easy to adjust pre-setting length of cutting tool (Saving time to pre-set cutting tool to one fifth compared with conventional Hydraulic Chuck)
- Precise adjustment of cutting tool length
- Designed to separate tool length adjustment screw from clamping screw



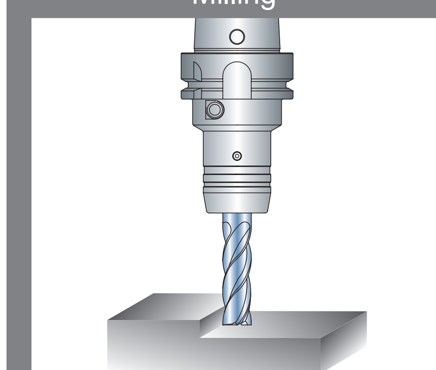




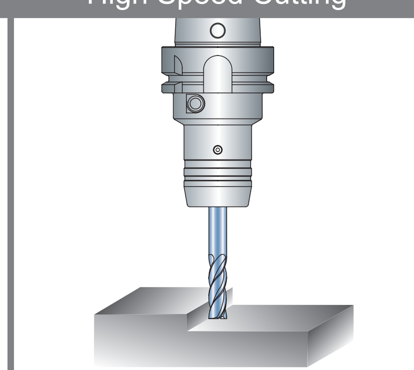
Adjustable range of cutting tool length : 0~0.394"

APPLICATION

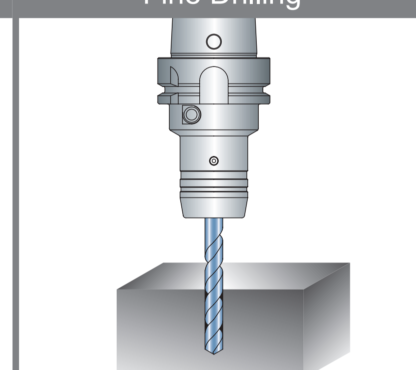
Milling



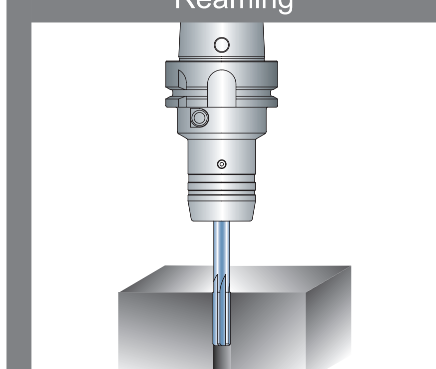
High Speed Cutting



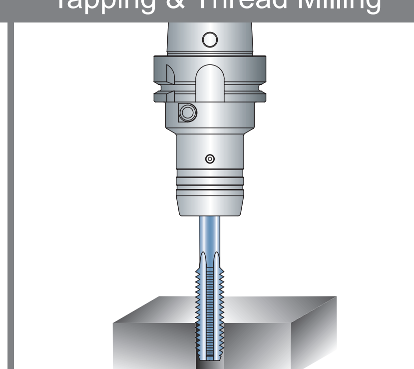
Fine Drilling



Reaming



Tapping & Thread Milling



Chamfering

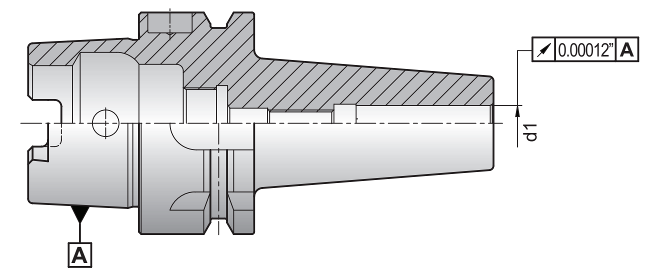
YG TECHNICAL INFORMATION

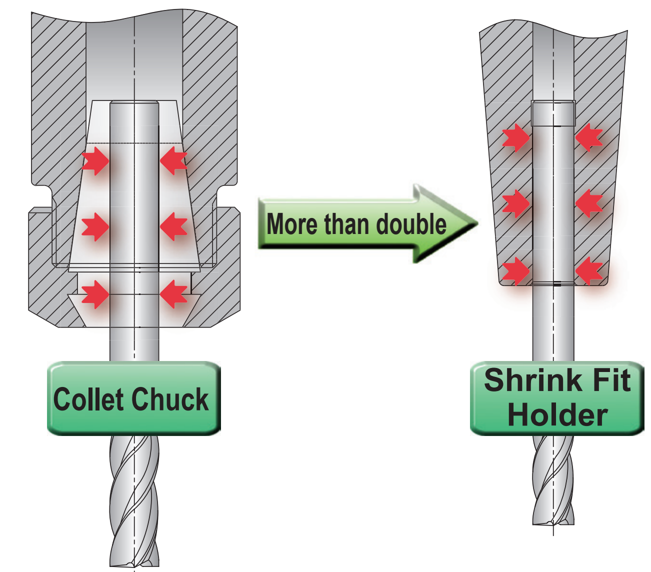
TECHNICAL INFORMATION (SHRINK FIT HOLDER)

High Precision I.D
Run-out : ≤ 0.00012"



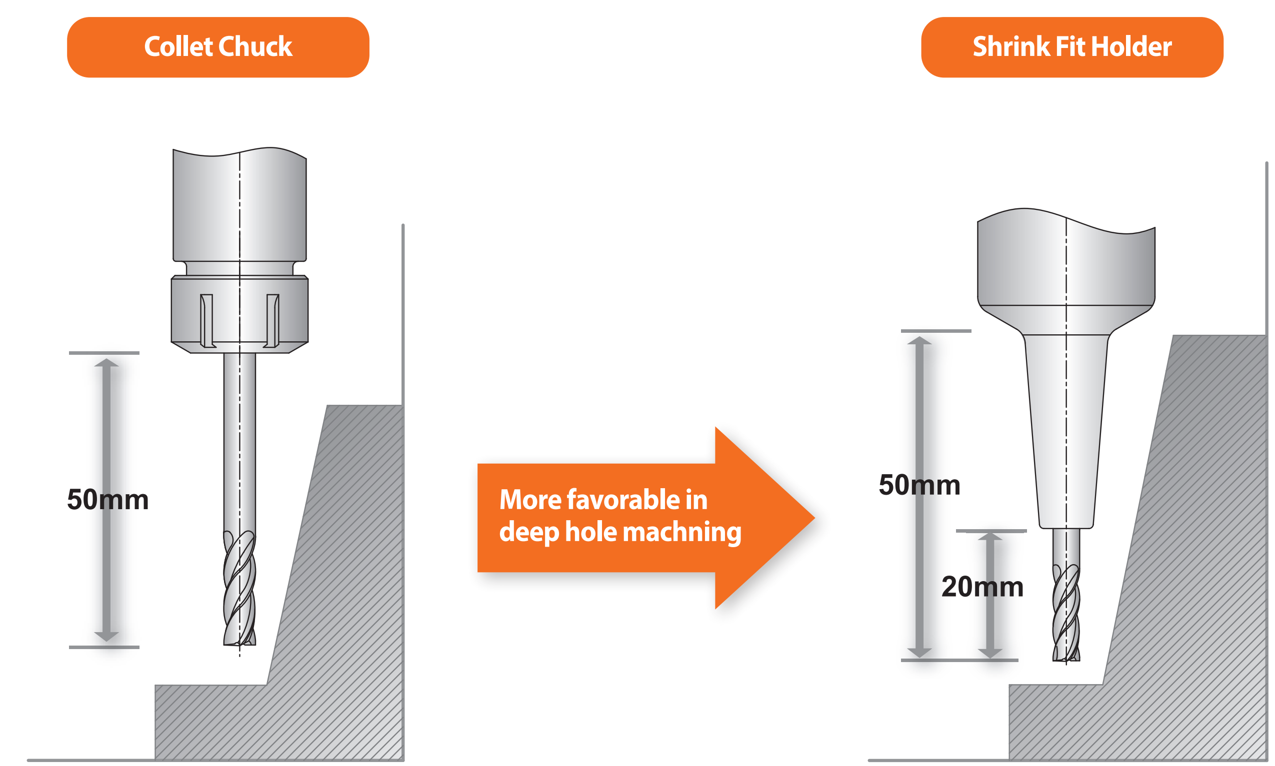
- Less than 0.00012" of Tool Holder accuracy at I.D

Strong and Consistent Torque Power



- Achieving strong torque power by integration of chuck and tool

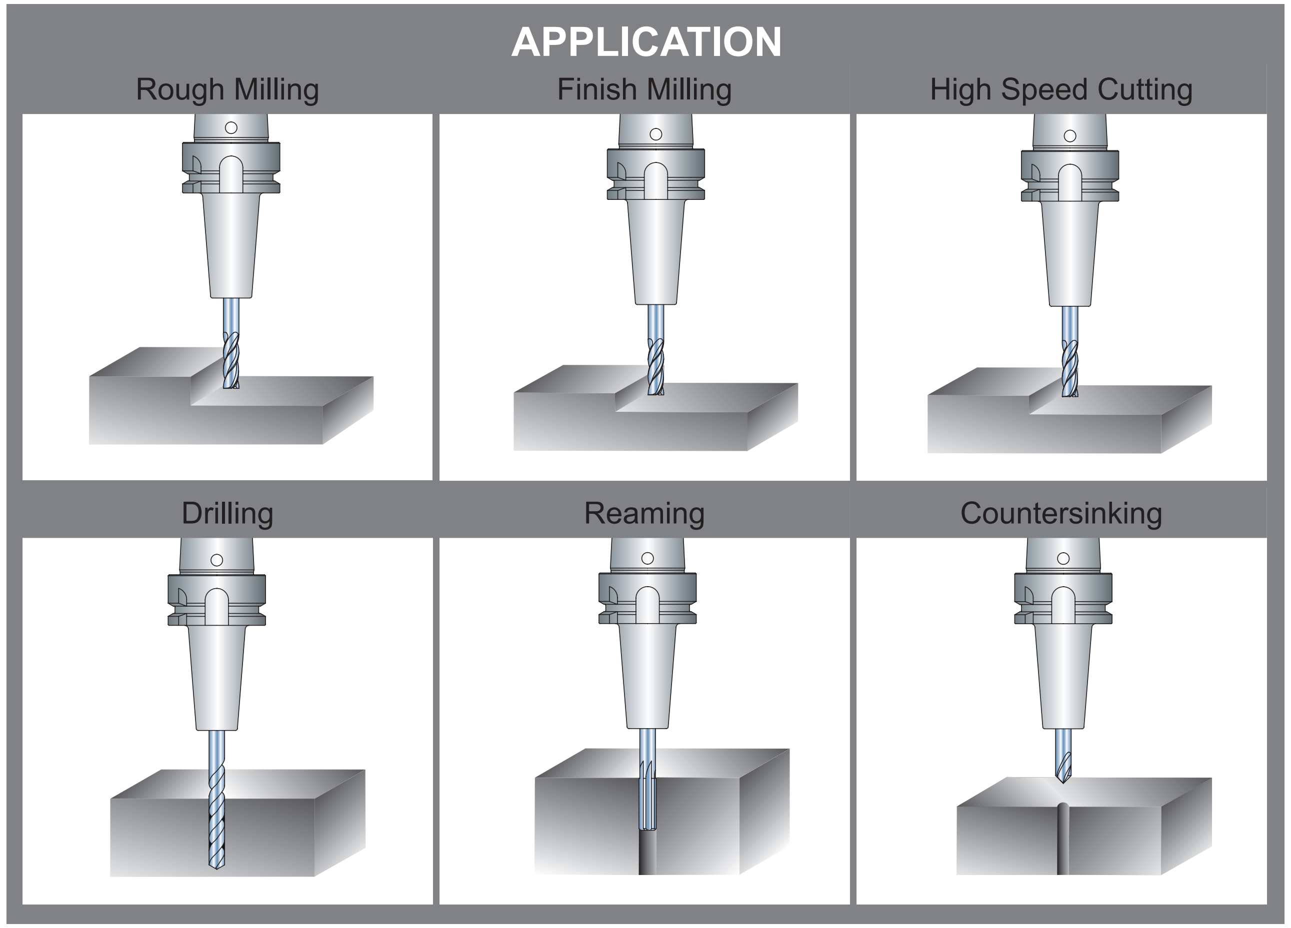
Deep hole Machining



- Suitable for High-Speed precision deep hole machining

YG TECHNICAL INFORMATION

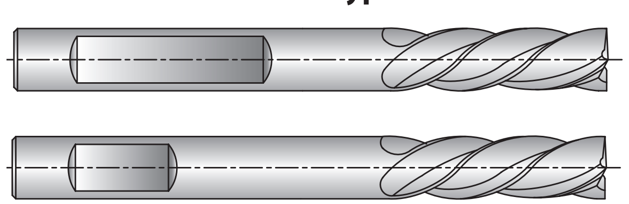
TECHNICAL INFORMATION (SHRINK FIT HOLDER)



Shank Type of Cutting Tool

Straight shank

One weldon flat shaft type



• One Weldon flat shaft type tool is usable, but there is a possibility that the I.D of shrink fit holder may be deformed.

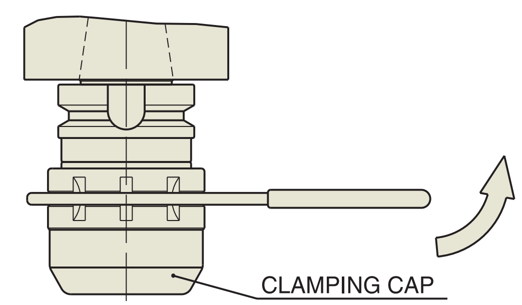
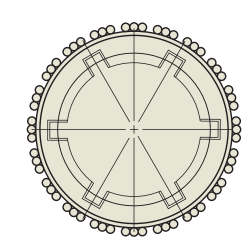
TECHNICAL INFORMATION (POWER MILLING CHUCK)

CLAMPING



STRUCTURE



SPECIAL FEATURES

TOOL CLAMPING

For complete tool clamping, clamping cap should be fully turned up to the point where the bottom of clamping cap touches the flange of tool holder.

HOLDING POWER

Thicker body structure od clamping cap assures strong holding power maximum durability and smooth movement of needle bearings 300 kgf holding force.

ACCURACY

Slots on the inside of bore help prevent excessive oil and grime from building up between shank of end mill and inside of bore which increases accuracy and holding power.

DURABILITY

Special engineered steels and alloys are used in the bearing and stop seal to increase life and reduce maintenance.
